(Received 9 November 1976)

A detailed classification is made of orthogonal coordinate systems for which the wave equation $\psi_{tt} - \Delta_3 \psi = 0$ admits an $R$-separable solution. Only those coordinate systems are given which are not conformally equivalent to coordinate systems that have been found in previous articles. We find 106 new coordinates to give a total of 367 conformally inequivalent orthogonal coordinates for which the wave equation admits an $R$-separation of variables.

**INTRODUCTION**

In this paper we discuss our investigation of the orthogonal $R$-separable coordinate systems for which the wave equation in space–time,

$$\psi_{tt} - \Delta_3 \psi = 0 \quad (\ast)$$

admits an $R$-separation of variables. In a previous article we have studied coordinate systems for which the Klein–Gordon equation

$$\psi_{tt} - \Delta_3 \psi = \lambda \psi \quad (\ast\ast)$$

admits a separation of variables. Such coordinate systems also admit a separation of variables for the wave equation $(\ast)$. In Paper 4 of this series we found 261 conformally inequivalent coordinate systems of this type. It is the purpose of this article to find coordinate systems for which $(\ast)$ admits a strictly $R$-separable solution. By this we mean those coordinate systems for which $(\ast)$ admits an $R$-separable solution and for which there is no conformally equivalent coordinate system such that $(\ast)$ is simply separable. As with the treatment of the wave equation in two space dimensions, we classify the different types of orthogonal coordinate systems whose coordinate surfaces are cyclides or their degenerate forms.

The content of the article is arranged as follows. In Sec. I we discuss the relevant details concerning coordinate systems whose coordinate surfaces are cyclides of most general type. This is a development of the methods in the fundamental book by Bôcher. Also in this section we give the various differential forms corresponding to the coordinate systems of interest. In Sec. II we present the coordinate systems together with the corresponding separation equations and triplet of mutually commuting operators $\{L_1, L_2, L_3\}$ which describe each system.

**I. $R$-SEPARABLE DIFFERENTIAL FORMS FOR THE WAVE EQUATION**

Here we classify orthogonal differential forms for which the wave equation $(\ast)$ admits a strictly "$R$-separable" separation of variables. We recall that if $\phi$ is a solution of $(\ast)$ which is $R$-separable in terms of some new coordinates $x_i$ ($i = 1, 2, 3, 4$), then $\phi$ can be written in the form

$$\phi = \exp(Q(x_1, x_2, x_3, x_4) \mid \phi)$$

where the equation for the function $Q$ is such that it admits a separation of variables. The factor $\exp(Q)$ is called the modulation function and has a definite form for each $R$-separable coordinate system. In addition no part of the function $Q$ should contain the sum of functions $f_i$ of only one of the variables $x_i$. For a strict $R$-separable system the modulation function $Q$ should not be zero. In a previous article where we treated the wave equation in two space variables, it was shown that only cyclidic coordinate systems whose coordinate surfaces were degenerate forms of confocal cyclides of the most general type were strictly $R$-separable. All remaining cyclidic $R$-separable coordinate systems could be transformed into coordinate systems for which the Klein Gordon equation $(\psi_{tt} - \Delta_3 \psi = \lambda \psi)$ also admits a separation of variables. This was done by a suitable transformation of the $O(3, 2)$ conformal symmetry group of $(\psi_{tt} - \Delta_3 \psi = 0)$. The same situation holds in the case of three spatial dimensions, and it is accordingly the purpose of this section to discuss confocal families of cyclides of general type and their degenerate forms. We now briefly outline the properties of cyclides of this type and refer the reader for details to our previous article and the book by Bôcher. Families of confocal cyclides have their natural setting in a six-dimensional projective space. Elements of this space are specified by six homogeneous coordinates $x_1 : x_2 : x_3 : x_4 : x_5 : x_6$, which are not all simultaneously zero and which are connected by the relation

$$y_1^2 + y_2^2 + y_3^2 + y_4^2 + y_5^2 + y_6^2 = 0. \quad (1.2)$$

The space–time coordinates are related to the homogeneous coordinates via the relations

$$y_1 = i(\rho^2 - q^2 - r^2 - s^2 + u^2),$$
$$y_2 = \rho^2 - q^2 - r^2 - s^2 - u^2,$$
$$y_3 = 2i\rho u, \quad y_4 = 2iqw, \quad y_5 = 2irw, \quad y_6 = 2isw. \quad (1.3)$$

Copyright © 1977 American Institute of Physics
where \( t = p/w, \ x = q/w, \ y = r/w, \ z = s/w. \) A cyclide is then defined as the locus of points lying on the quadric surface

\[
\Phi = \sum_{i=1}^{6} a_i y_i y_j = 0
\]

with \( a_i = a_{ij} \) and \( \det(a_{ij}) \neq 0. \) The classification of cyclides under the group of orthogonal transformations which preserves the form

\[
\sum_{i=1}^{6} y_i^2 = 0
\]

is then the problem of classifying the intersections of two quadratic forms in six-dimensional projective space. This is performed by the method of elementary divisors applied to the two quadratic forms. (For the details of this classification see Refs. 5, 6.)

The equation describing the most general family of confocal cyclides in this six-dimensional projective space is

\[
\sum_{i=1}^{6} y_i^2 - c_i = 0, \ \sum_{i=1}^{6} y_i^2 = 0. \quad (1.4)
\]

Here \( \lambda \) is one of the new curvilinear coordinates and \( e_j \neq e_j, \) if \( i \neq j, \) \( (i, j = 1, \ldots, 6). \) If we choose an orthogonal coordinate system in space—time whose coordinate surfaces have equations of the type (1.4), then the line element in terms of these new coordinates becomes

\[
d s^2 = 1/4\pi^4 \left[ \sum_{i=1}^{6} \frac{(x_i - x_j)(x_i - x_k)(x_i - x_l)}{f(x_i)} d x_i^4 \right] \quad (1.5)
\]

where

\[
f(x_i) = \prod_{j=1}^{6} (x_i - e_j) \quad \text{and} \quad -1/\sigma = \sum_{i=1}^{6} e_j y_i^2.
\]

The coordinates \( y_i \) are related to the curvilinear coordinates \( x_i \) via the equations

\[
y_i = \phi(x_i)/f'(x_i), \quad i = 1, \ldots, 6, \quad (1.6)
\]

where \( \phi(\lambda) = \prod_{j=1}^{6} (\lambda - x_j). \) If we write the solution \( \psi \) of the wave equation as

\[
\psi = (e^{2s/4\pi}) \phi, \quad (1.7)
\]

then \( \Phi \) satisfies the differential equation

\[
\frac{\delta}{\delta x_i} \left[ \left( \frac{1}{\psi(x_i)} \frac{\delta \Phi}{\delta x_i} \right)^2 - 2 \left( \frac{\delta \Phi}{\delta x_i} \right) \right] \Phi = 0, \quad (1.8)
\]

where \( 2d\psi = dx_i/\sqrt{\psi(x_i)}. \) This equation admits separable solutions for the function \( \Phi, \) i.e.,

\[
\phi = \prod_{j=1}^{6} E_j(x_j).
\]

Each of the functions \( E_j \) satisfies the differential equation

\[
\frac{d^2 E_j}{d x_j^2} + \left[ 3x_j^4 - 2 \left( \sum_{i=1}^{6} e_i \right) x_j^3 + A x_j^2 + B x_j + C \right] E_j = 0. \quad (1.9)
\]

We now proceed to classify coordinate systems of this type by considering the expression inside the square brackets in (1.5) and finding out what ranges of the coordinates \( x_i \) permit this differential form to have over-all negative signature. We must also consider degenerate forms of these general coordinate systems which result when some of the \( e_i \) become equal. In addition we should mention that two confocal families of cyclides of type (1.4) are equivalent under the action of real linear transformations of the coordinates \( y_i \) which preserve the quantity \( \sum_{i=1}^{6} y_i^2 \) if their parameters \( e_i, \ e_i' \) and coordinates \( x_i, \ x_i' \) are related by the equations

\[
e_i = a e_i' + b, \quad x_i = a x_i' + b, \quad (1.10)
\]

where \( \alpha, \beta, \gamma, \delta \in \mathbb{R} \) and \( a \delta - \beta \gamma \neq 0. \)

We now give the classification of the strictly \( R \)-separable coordinate systems, in particular the differential forms.

[1] The first type of differential form corresponds to \( R \)-separable coordinate systems of the type (1.6) for which all the \( e_i \) are real. In addition the relations (1.10) can be used to standardize these quantities so that \( e_1 = \alpha, \ e_2 = \alpha, \ e_3 = \delta, \ e_4 = \alpha, \ e_5 = 1, \ e_6 = 0 \) with \( a > b > c > 1. \) The differential form then becomes

\[
ds^2 = \left( \frac{1}{4\pi^4} \right) \left[ \sum_{i=1}^{6} (x_i - x_j)(x_i - x_k)(x_i - x_l)/h(x_i) \right] \quad (1.11)
\]

where \( h(x) = (x - a)(x - b)(x - c)(x - 1). \) The ranges of variation of the variables \( x_i \) are

\[
x_1, x_2, x_3 > a > b > c > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.12)
\]

[2] The differential forms of this type are as in (1.11) but with \( b = a^* \) and \( a, b, c \in \mathbb{R}. \) The ranges of variation of the variables \( x_i \) are

\[
x_1, x_2, x_3 > a > b > c > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.13)
\]

[3] In this case the quantities \( e_i \) can be taken to be

\[
e_1 = \infty, \quad e_2 = e_3 = e_4 = \gamma + i \delta, \quad e_5 = 0, \quad e_6 = \alpha, \beta, \gamma, \delta \in \mathbb{R}.
\]

The differential form is given as in (1.11) with \( h(x) = (x - \gamma)^2 + \delta^2 [(x - \alpha)^2 + \beta^2]. \) The ranges of variation of the variables \( x_i \) are then

\[
x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad x_1, x_2, x_3 > a > b > c > x_4 > 1; \quad (1.14)
\]

The simplest types of degenerate differential forms corresponding to cyclides of general type (1.4) are obtained by allowing pairs of the quantities \( e_i \) to become equal. This is achieved by the prescription given by Böcher,\(^b\) e.g., if \( e_1 \) and \( e_2 \) become equal then they do so according to the prescription

\[
e_1 = e_2 + \epsilon, \quad x_1 = e_2 + \epsilon y_1' \quad (1.15)
\]

where \( \epsilon \) is a first order quantity. With this substitution and the subsequent use of the relations (1.10) to take
The differential form becomes
\[
ds^2 = \left( \frac{y_1^2 + y_2^2}{4\epsilon^4} \right)^2 \left\{ \frac{dx_{12}^2}{x_1(x_1 - 1)} - \frac{dx_{14}^2}{x_1} \right\}, \tag{1.16}
\]
where \( h(x) = (x - a)(x - b)(x - c)(x - d) \). If we make the same substitution in (1.6) relating the coordinates \( y_i^2 \), we obtain
\[
y_i^2 = 1 - x_i', \quad y_i^2 = x_i' \tag{1.17}
\]
In addition we note that the coordinate surface for the coordinate \( x_1' \) has the equation
\[
y_1^2(x_1' - 1) + y_2^2x_1' = 0. \tag{1.18}
\]
From the form of the coordinates in (1.6) we see that the real linear transformations which preserve the quantity \( y_i^2 \) form a group isomorphic to \( O(4, 2) \). In fact the representation of a point in space–time by the six coordinates is such that the generators of the conformal symmetry group of the wave equation.

More specifically we have the relations
\[
L_{12} = \frac{1}{2}(K_2 - P_2), \quad L_{13} = \frac{1}{2}(K_2 - P_3), \quad L_{14} = \frac{1}{2}(K_2 - P_4),
L_{15} = \frac{1}{2}(K_2 + P_3), \quad L_{16} = iD, \quad L_{23} = iN_1, \quad L_{24} = iN_2,
L_{25} = iN_3, \quad L_{26} = i(2)(P_2 + K_2), \quad L_{34} = iM_2, \quad L_{35} = iM_3, \quad L_{36} = \frac{1}{2}(P_1 + K_1),
L_{45} = M_1, \quad L_{46} = \frac{1}{2}(P_2 + K_2), \quad L_{56} = \frac{1}{2}(P_3 + K_3). \tag{1.19}
\]
Here we have used the notation of Refs. 3 and 4 for the generators of the conformal symmetry group.

Taking note of these relations, we see that coordinate systems of the type given by (1.17) correspond to the diagonalization of the generator \( L_{36} = y_1^2x_1' - y_2^2x_1' \). This generator may correspond to a rotation or a hyperbolic rotation in pentaspherical space. If a hyperbolic rotation, we may always use an \( O(4, 2) \) group motion to ensure that \( L_{36} = D \). The resulting coordinate system in space–time is then equivalent to one of the radial coordinate systems discussed in reference 4. Accordingly in classifying differential forms of type (1.16) we need only consider those for which \( 0 < x_1' < 1 \).

[4] If we choose \( a \sim b \sim c = 1 \sim d = 0 \) then we have the possibilities
\[
a > x_2 > b > x_3 > 1 > x_4 > 0; \quad x_2 > a = x_3 > b > x_4 > x_4 > 0; \quad x_2 > a < x_3 > b > 1 > x_4 > 1; \quad x_2 > x_3 > b > x_4 > 0; \quad x_2 < x_3 > b > 1 > x_4 > 0.
\]

[5] If \( a = b = \alpha + i\beta, \quad \alpha, \beta \in \mathbb{R} \) and \( c = 1, \quad d = 0 \), then we have the possibilities
\[
x_2 > x_3 > a > 1; \quad x_2 > x_3 > x_4 > 0; \quad x_2 > x_3 > b > x_4 > 1; \quad 0 > x_4; \tag{1.20}
\]
\[
(1.21)
\]
\[
(1.22)
\]
\[
(1.23)
\]
\[
(1.24)
\]
\[
(1.25)
\]
\[
(1.26)
\]
\[
(1.27)
\]
\[
(1.28)
\]
where \( P(x) = (x - e_1)(x - e_2)(x - e_3) \) and \( Q(x) = (x - a) \times (x - 1)x \). This differential form corresponds to the reductions \( O(4, 2) \supset O(3) \otimes O(2, 1) \) and \( O(4, 2) \supset O(2, 1) \) \( \supset O(1, 1) \), which can be conformally transformed into a radial system, we can in principle write down all the differential forms corresponding to the reductions of type \( O(4, 2) \supset O(3) \otimes O(2, 1) \) and \( O(4, 2) \supset O(2, 1) \) \( \supset O(1, 1) \) by considering degenerate forms of the differential form (1.28), but we do not do this here.

With the exception of the reduction \( O(2, 1) \supset O(1, 1) \), which can be conformally transformed into a radial system, we can in principle write down all the differential forms corresponding to the reductions of type \( O(4, 2) \supset O(3) \otimes O(2, 1) \) and \( O(4, 2) \supset O(2, 1) \) \( \supset O(1, 1) \) by considering degenerate forms of the differential form (1.28), but we do not do this here.

The remaining distinct type of differential form of interest in this section is obtained by taking \( x_2 = e_3 + \epsilon' x_3 \) and \( x_3 = e_6 + \epsilon' \) subsequent to the substitutions (1.27) and then allowing \( \epsilon' \to 0 \). We then obtain the differential form
\[
\begin{align*}
dx^2 &= \left( \frac{y_1^2 + y_2^2 + y_3^2 + y_4^2}{4u^2} \right) \left[ \frac{dx_1^2}{x_1(1-x_1)} + \frac{dx_2^2}{x_2(1-x_2)} + \frac{dx_3^2}{x_3(1-x_3)} ight], \\
&+ x_3'(x_3'-x_4') \left( \frac{dx_3^2}{Q(x_3)} - \frac{dx_4^2}{Q(x_4)} \right),
\end{align*}
\]
(1.29)

In each class we have \( 0 < x_1 < 1, \ 0 < x_2 < 0 \). The remaining variables vary in the ranges
\[
\begin{align*}
0 < x_3' < 1 < x_4' &< a; \quad 1 < x_3' < a < x_4'; \\
0 < x_3' < x_4' &< x_4'; \\
0 < x_3' < x_4' &< x_4'.
\end{align*}
\]

A further differential form can be obtained from the limits \( a = 1 + \epsilon', \ x_1' = 1 + \epsilon x_3' \). This gives one new differential form
\[
\begin{align*}
dx^2 &= \left( -\frac{(y_3^2 + y_4^2 + y_5^2 + y_6^2)}{4u^2} \right) \left[ \frac{dx_1^2}{x_1(1-x_1)} \\
&+ \frac{dx_2^2}{x_2(1-x_2)} + x_3'(1-x_3') \frac{dx_3^2}{x_3(1-x_3')} \\
&+ \frac{dx_4^2}{x_4(1-x_4')} \right],
\end{align*}
\]
(1.30)

where all the variables lie between 0 and 1.

We have shown in this section how to get orthogonal coordinate systems by various limiting procedures applied to coordinate systems of the most general cycloidal type. We have as yet not fully understood in what sense these procedures are complete.

II. \( R \)-SEPARABLE COORDINATES FOR THE WAVE EQUATION

In this section we give the coordinate systems corresponding to the differential forms in section I together with the separation equations. We also present the triplet \( L_1, L_2, L_3 \) of mutually commuting second order symmetric operators in the enveloping algebra of \( O(4, 2) \) whose eigenvalues are the separation constants for each coordinate system presented. We tabulate the coordinate systems of interest starting with the most general real cycloidal type.

E.G. Kalnins and W. Miller, Jr.

1744

Coordinate systems of Class I

(1) \( \cdots \rightarrow (5) \) (a) A suitable choice of coordinates is
\[
\begin{align*}
l &= 1 \\
x &= \frac{1}{R} \left[ \frac{(x_3 - a)(y_3 - b)(y_4 - c)(y_5 - d)}{(a - b)(a - c)(a - d)} \right]^{1/2}, \\
y &= \frac{1}{R} \left[ \frac{(x_3 - c)(y_3 - c)(y_4 - c)}{(c - b)(c - c)} \right]^{1/2}, \\
z &= \frac{1}{R} \left[ \frac{(x_3 - c)(y_3 - c)(y_4 - c)}{(1 - c)} \right]^{1/2},
\end{align*}
\]
(2.1)

The solution of the wave equation then assumes the form
\[
\psi = R \Phi, \quad \Phi = \prod \psi_i(E_i(x_j)) \text{ typically.}
\]

The separation equations for the functions \( E_i \) are
\[
\frac{d^2E_i}{dx_j^2} + \frac{1}{x_j - a} \left[ \frac{1}{x_j - b} + \frac{1}{x_j - c} + \frac{1}{x_j - 1} \right] \frac{dE_i}{dx_j} = 0.
\]
(2.2)

The operators \( L_i \), whose eigenvalues \( l_i \) are the separation constants are
\[
\begin{align*}
L_1 &= \frac{1}{4}(a + b + c)(P_1 + K_1)^2 + \frac{1}{4}(a + b + c)(P_2 + K_2)^2 \\
&+ \frac{1}{4}(a + c + 1)(P_1 + K_1)^2 - \frac{1}{4}(b + c + 1)(P_2 + K_2)^2 \\
&+ \frac{1}{4}(a + b)(P_3 + K_3)^2 - \frac{1}{4}(a + c)(P_4 + K_4)^2 \\
&- \frac{1}{4}(b + c + 1)(P_5 + K_5)^2, \\
L_2 &= \frac{1}{4}(a + b + c)(P_3 + K_3)^2 + \frac{1}{4}(a + b + c)(P_4 + K_4)^2 \\
&+ \frac{1}{4}(a + c + 1)(P_2 + K_2)^2 - \frac{1}{4}(a + c)(P_1 + K_1)^2 \\
&- \frac{1}{4}(b + c)(P_3 + K_3)^2 - \frac{1}{4}(b + c)(P_4 + K_4)^2, \\
L_3 &= -\frac{1}{4}(a + b + c)(P_1 + K_1)^2 - \frac{1}{4}(a + b + c)(P_2 + K_2)^2 \\
&- \frac{1}{4}(a + b + c)(P_3 + K_3)^2 - \frac{1}{4}(a + b + c)(P_4 + K_4)^2.
\end{align*}
\]

The coordinates \( x_i \) vary in the ranges
\[
x_1 < a < b < x_2 < c < x_3 < 1 < x_4 < 2. 
\]

There are four more coordinate systems of this type. We list below the complex transformation of the space time coordinates which relates the coordinates of type (a) to the new system, together with the new ranges of variation of the coordinates \( x_i \). The separation equations for the \( E_i(x_j) \) are the same in each case and the basis defining operators can be obtained by the substitution given. We now list the possibilities:

(b) \( \{ t, x, y, z \} \rightarrow \{ i, x, y, z \} \)

where \( P(x) = (x - e_1)(x - e_2)(x - e_3) \) and \( Q(x) = (x - a) \times (x - 1)x \). This differential form corresponds to the reductions \( O(4, 2) \supset O(3) \otimes O(2, 1) \) and \( O(4, 2) \supset O(2, 1) \) \( \supset O(1, 1) \), which can be conformally transformed into a radial system, we can in principle write down all the differential forms corresponding to the reductions of type \( O(4, 2) \supset O(3) \otimes O(2, 1) \) and \( O(4, 2) \supset O(2, 1) \) \( \supset O(1, 1) \) by considering degenerate forms of the differential form (1.28), but we do not do this here.
The solution of the wave equation has the form \( \psi = R\Phi \), where each of the \( E_j \) satisfies Eq. (2.2). The operators whose eigenvalues are the separation constants are

\[
L_1 = \frac{1}{2} (2\alpha + c)(P_3 + K_3)^2 + \frac{1}{2}(2\alpha + 1)(P_2 + K_2)^2
- \beta (P_3 + K_3)^2 + \alpha (P_2 + K_2)^2
+ \sqrt{(\text{a} N_3 - M_3)^2} - \sqrt{(\text{b} N_3 - M_3)^2},
\]

\[
L_2 = \frac{1}{2} (2\alpha + c + \beta)(P_3 + K_3)^2
- \frac{1}{2}(2\alpha + c + \beta)(P_2 + K_2)^2
+ \alpha (P_3 + K_3)^2 - \beta (P_2 + K_2)^2
+ \sqrt{(\text{a} N_3 - M_3)^2} - \sqrt{(\text{b} N_3 - M_3)^2},
\]

\[
L_3 = \frac{1}{2} (2\alpha + c + \beta)(P_3 + K_3)^2
+ \alpha (P_3 + K_3)^2 - \beta (P_2 + K_2)^2
+ \sqrt{(\text{a} N_3 - M_3)^2} - \sqrt{(\text{b} N_3 - M_3)^2},
\]

The operators whose eigenvalues are the separation constants are

\[
L_1 = (2\alpha + c)(M_3^2 - N_3^2) + \delta (M_1, N_2),
\]

\[
+ (2\alpha + 1)(M_2^2 - N_2^2),
\]

\[
+ \frac{1}{2}\delta (M_3, P_3 - K_3, P_4 - K_4)
+ \frac{1}{2}\gamma (P_3 - K_3)^2 - \frac{1}{2}\gamma (P_2 - K_2)^2
+ (\alpha + \beta)(P_3 + K_3)^2 + (\alpha + \beta)(P_2 + K_2)^2
+ \frac{1}{2}\delta (N_1, P_0 - K_0, P_2 - K_2)
- \delta (N_1, M_3, \beta (P_2 - K_2, P_3 - K_3)),
\]

\[
L_2 = (2\alpha + c + \beta)(M_3^2 - N_3^2) - 2\alpha \delta (M_3, N_3)
+ (\alpha + \beta)(P_3 - K_3)^2
+ (\alpha + \beta)(P_2 - K_2)^2
+ \gamma (P_3 - K_3)^2 - \gamma (P_2 - K_2)^2
+ \frac{1}{2}\delta (N_1, P_0 - K_0, P_2 - K_2)
- \delta (N_1, M_3, \beta (P_2 - K_2, P_3 - K_3)),
\]

\[
L_3 = (2\alpha + c + \beta)(\gamma (N_3^2 - M_3^2) - 2\alpha \delta (N_3, M_3))
+ (\alpha + \beta)
\times (\alpha (P_3 - K_3)^2 - \beta (P_2 - K_2, P_3 - K_3)).
\]

The variables \( x_1, x_2, x_3, x_4 \) can vary in the ranges \( x_1 > 0 > x_2, x_3, x_4 \) and \( x_1, x_2, x_3, x_4 > 0 \).

Coordinate systems of Class II

These are the coordinate systems in which the operator \( \frac{1}{2}(P_0 - K_0) \) is diagonal.

As has been discussed in Ref. 3, the \( R \)-separable solutions of \( (\ast) \) then have the form \( \psi = (Y_0 - \cos \phi) \times \exp[i(2F + 1)I_1] \Phi(Y_0, Y_1, Y_2, Y_3) \), where \( Y_0^2 + Y_1^2 + Y_2^2 + Y_3^2 = 1 \) and the space-time coordinates are given by

\[
l = \sin \phi, \quad x = \frac{Y_0}{Y_0 - \cos \phi},
\]

\[
y = \frac{Y_0}{Y_0 - \cos \phi}, \quad z = \frac{Y_0}{Y_0 - \cos \phi}.
\]

\( i(2F + 1) \) is the eigenvalue of the operator \( \frac{1}{2}(P_0 - K_0) \), and \( F \) is a positive integer or half-integer. The function \( \Phi \) satisfies the equation

\[
(\Gamma_{13}^2 + \Gamma_{14}^2 + \Gamma_{13}^2 + \Gamma_{14}^2 + \Gamma_{13}^2 + \Gamma_{14}^2) \Phi = -4F(2F + 1)\Phi,
\]

where \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{14} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{14} = \frac{1}{2}(P_3 + K_3) \), and \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \). Here we are using the notation of Ref. 3. The problem of separation of variables for coordinate systems in which \( \frac{1}{2}(P_0 - K_0) \) is diagonal reduces to the problem of separation of variables on the three-dimensional sphere \( S_3 \) in 4-space.

Acting on the functions \( \Phi \), the operators given above have the form

\[
(\Gamma_{13} + \Gamma_{14} + \Gamma_{13} + \Gamma_{14} + \Gamma_{13} + \Gamma_{14}) \Phi = -4F(2F + 1)\Phi,
\]

where \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{14} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \), \( \Gamma_{14} = \frac{1}{2}(P_3 + K_3) \), and \( \Gamma_{13} = \frac{1}{2}(P_3 + K_3) \).

This problem has been solved by Olevski and the six coordinate systems on \( S_3 \) for which (2.10) admits separation of variables have recently been investigated.

E.G. Kalnins and W. Miller, Jr.
In the interest of completeness we give here the six coordinate systems, the separation equations, the operators describing the separation, and some comment on the actual solutions.

(9) Ellipsoidal coordinates: A suitable choice of coordinates is
\[
Y_i^2 = \frac{(x_i - a)(x_i - b)(x_i - c)}{(b - a)(1 - a) a},
\]
\[
Y_1^2 = \frac{(x_1 - b)(x_1 - b)(x_1 - b)}{(a - b)(1 - b) b},
\]
\[
Y_2^2 = \frac{(x_2 - 1)(x_2 - 1)(x_2 - 1)}{(a - 1)(1 - 1) 1},
\]
\[
Y_3^2 = \frac{x_1 x_2 x_3}{ab},
\]
where \(0 < x_1 < 1 < x_2 < x_3 < a\). The separation equations for \(\Phi = E_1(x_1)E_2(x_2)E_3(x_3)\) have the form
\[
dE_1 + \frac{1}{x_i - a + 1} + \frac{1}{x_i - b + 1} + \frac{1}{x_i - c + 1} E_1 = 0,
\]
\[
\left[4F(F + 1)x^2_1 + 4x_1 + 4\right] E_1 = 0.
\]
(2.12)

The operators whose eigenvalues are the separation constants \(l_1\) and \(l_2\) are
\[
L_1 = \frac{1}{2}(P_1 + K_1)^2 + \frac{1}{2}(b + 1)(P_2 + K_2)^2 + \frac{1}{2}(a + 1)(M_3)^2,
\]
\[
L_2 = \frac{1}{2}(b + K_2)^2 - ab(M_3)^2.
\]
(2.13)

(10) Elliptic cylindrical coordinates of Type I: A suitable choice of coordinates is
\[
Y_0 = \sqrt{x_1 x_2} / a \cos \phi,
\]
\[
Y_1 = \sqrt{x_1 x_2} / a \sin \phi,
\]
\[
Y_2 = \sqrt{(x_1 - a)(x_1 - b)/a(a - 1)},
\]
\[
Y_3 = \sqrt{(x_1 - 1)(x_1 - 1)/(1 - a)},
\]
where \(0 < x_1 < 1 < x_2 < a\).

The separation equations have the form for \(\Phi = E_1(x_1)E_2(x_2)A(\phi)\):
\[
d^2E_i + \frac{1}{x_i - a + 1} + \frac{1}{x_i - b + 1} + \frac{1}{x_i - c + 1} E_i = 0
\]
\[
\left[4F(F + 1)x^2_1 + 4x_1 + 4\right] E_i = 0
\]
(2.16)

We then have that
\[
y_4 = \sin \phi \cos \phi,
\]
\[
y_1 = \sin \phi \sin \phi,
\]
\[
y_2 = \cos \phi \sin \phi,
\]
\[
y_3 = \sin \phi \cos \phi,
\]
\[
y_4 = \sin \phi \cos \phi,
\]
where \(0 < \rho_i < 2K\) and \(-K' < \rho_i < K'\). [Note: \(\text{sn}(z, k)\) is a Jacobi elliptic function.] In terms of these coordinates the solution for \(\Phi\) has the form
\[
\Phi = (\sin \phi \cos \phi)^{m} K^{p}_{q}(\rho_4)
\times K^{n}_{q}(\text{sn}(\rho_4))
\]
(2.19)

Here \(K^{p}_{q}(\rho)\) is an associated Lamé polynomial as defined in Ref. 8.

(11) Elliptic cylindrical coordinates of Type II: A suitable choice of coordinates is
\[
Y_0 = \sqrt{(x_1 - 1)(x_1 - 1)/(1 - a)} \cos \phi,
\]
\[
Y_1 = \sqrt{(x_1 - 1)(x_1 - b)/(a(a - 1))} \sin \phi,
\]
\[
Y_2 = \sqrt{(x_1 x_2)/a}.
\]
(2.20)

The separation equations have the form \(\Phi = E_1(x_1)E_2(x_2)A(\phi)\):
\[
d^2E_i + \frac{1}{x_i - a + 1} + \frac{1}{x_i - b + 1} + \frac{1}{x_i - c + 1} E_i = 0
\]
\[
\left[4F(F + 1)x^2_1 + 4x_1 + 4\right] E_i = 0
\]
(2.21)

where \(i = 1, 2, 3\),
\[
(a - 1) \frac{dE_i}{d\phi^2} + l_i E_i = 0.
\]

The operators whose eigenvalues are the separation constants \(l_1\) and \(l_2\) are
\[
L_1 = M_3^2 + \frac{1}{4}(P_1 + K_1)^2 + \frac{1}{4}(b + 1)(P_2 + K_2)^2 + \frac{1}{4}(a + 1)(M_3)^2 + \frac{1}{4}(1 - a)(P_1 + K_1)^2,
\]
\[
L_2 = \frac{1}{4}(a - 1)(P_1 + K_1)^2.
\]
(2.22)

These coordinates can also be written in terms of Jacobi elliptic functions by the same substitution as used for system 10. We then obtain
\[
Y_1 = \sin \phi \cos \phi,
\]
\[
Y_1 = \sin \phi \sin \phi,
\]
\[
Y_4 = \sin \phi \cos \phi,
\]
\[
Y_4 = \sin \phi \cos \phi,
\]
(2.23)

In terms of these coordinates the solution for \(\Phi\) has the form
\[
\Phi = (\sin \phi \cos \phi)^{m} K^{p}_{q}(k \sin \phi)
\times K^{n}_{q}(\text{sn}(k \sin \phi))
\]
(2.24)

(12) Spheroidal coordinates: A suitable choice of

\[\text{E.G. Kalnins and W. Miller, Jr.}\]

The coordinate system can also be written in terms of elliptic functions as with coordinate systems 10 and 11. This gives the parametrization:

\[ Y_1 = \sin \alpha \sin \beta \cos \phi, \quad Y_2 = \sin \alpha \sin \beta \sin \phi, \quad Y_3 = \cos \alpha, \quad Y_4 = \cos \phi, \]

where \( 0 < \alpha < \pi, \quad 0 < \phi < 2\pi. \)

A typical solution of the form \( A(\alpha)B(\beta)C(\phi) \) is

\[ \Phi = (\sin \alpha)^{1/2} \cos \beta \cos \phi \exp(i m \phi). \]

The two operators characterizing this system are

\[ L_1 = (a+b)D^2 - \frac{1}{2}(a+1)(P_2 - K_2)^2 \]

\[ L_2 = abD^2 + \frac{1}{2}(a+1)(P_2 - K_2)^2 + \frac{1}{2}(P_2 - K_2)^2, \]

with eigenvalues \(-\ell(\ell+1)\) and \(m^2\), respectively.

(13) **Spherical coordinates:** A suitable choice of coordinates is

\[ Y_0 = \sin \alpha \sin \beta \cos \phi, \quad Y_1 = \sin \alpha \sin \beta \sin \phi, \quad Y_2 = \cos \alpha, \quad Y_3 = \cos \phi, \]

where \( 0 < \alpha < \pi, \quad 0 < \phi < 2\pi. \)

A typical solution of the form \( A(\alpha)B(\beta)C(\phi) \) is

\[ \Phi = (\sin \alpha)^{1/2} \cos \beta \cos \phi \exp(i m \phi). \]

The two operators characterizing this system are

\[ L_1 = (a+b)D^2 - \frac{1}{2}(a+1)(P_2 - K_2)^2 \]

\[ L_2 = abD^2 + \frac{1}{2}(a+1)(P_2 - K_2)^2 + \frac{1}{2}(P_2 - K_2)^2, \]

with eigenvalues \(-\ell(\ell+1)\) and \(m^2\), respectively.

(14) **Cylindrical coordinates:** A suitable choice of coordinates is

\[ Y_0 = \sin \alpha \cos \beta, \quad Y_1 = \sin \alpha \sin \beta, \quad Y_2 = \cos \alpha \cos \phi, \quad Y_3 = \cos \alpha \sin \phi, \]

where \( 0 < \alpha < \pi, \quad 0 < \beta, \quad 0 < \phi < 2\pi. \)

A typical solution of the form \( A(\alpha)B(\beta)C(\phi) \) is

\[ \Phi = \exp(i \phi) \sin \alpha \cos \beta \exp(i m \phi), \]

\[ \times \Psi(b - F, a + b + 1 - \tan^2 \alpha), \]

where \( m = a + b, \quad p = a - b. \) The two operators characterizing this system are

\[ L_1 = (b-F)(a+b+1) \]

\[ L_2 = M_1^2, \]

with eigenvalues \(-\ell(\ell+1)\) and \(m^2\), respectively.

These are the analogs of the elliptical coordinates of type 9. The difference is that coordinate systems of this type correspond to the diagonalization of \( M_1^2 \) rather than \( \frac{1}{2}(P_0 - K_0)^2. \) We now list the possibilities.

(15) (a) A suitable choice of coordinates is

\[ t = \frac{1}{(b-a)}(x_2 - a)(x_2 - b)/\sqrt{(x_2 - a)(x_2 - b)(a-b)(b-a)}, \]

\[ x = (1/R) \cos \phi, \quad y = (1/R) \sin \phi, \]

\[ z = (1/R) \sin x_2 = (1/R) \sin x_2 = (1/R) \sin x_2. \]

The typical solution of the wave equation is \( \Phi = R \Phi, \)

\[ \text{where} \quad \Phi = \exp[i(2F + 1)\phi]. \]

The ranges of variation of the coordinates \( x_2, x_3, \) and

\[ x_3 > b > x_3 > a > x_3 > x_4 > 1; \]

\[ b > x_2 > 1 > x_2 > x_3 > a > x_2 > x_3 > 1. \]
The separation equations are given by (2.13). The operators whose eigenvalues are $l_1$ and $l_2$ are

\[
L_1 = 2aD^2 + \frac{1}{2} (a + 1) [(P_3 - K_3)^2 -(P_0 - K_0)^2]
- \frac{1}{2} \delta [P_0 P_3 + K_0 K_3] + \frac{1}{2} \delta (P_0 + K_3)^2 - (P_0 + K_0)^2] = N_3^2,
\]

\[
L_2 = (a^2 + \beta^2)D^2 + \frac{1}{2} \alpha [P_0 P_3 + K_0 K_3] - (P_0 - K_0)^2
+ \frac{1}{2} \delta P_3 - K_3, P_0 - K_0]\]

The separation equations in the variables $x_2$, $x_3$, and $x_4$ are

\[
\frac{d^2 E_1}{dx_1^2} + \frac{1}{2} \frac{(x_1 - a)(x_3 - a)(x_4 - a)}{(a - b)(a - c)(a - d)} \frac{1}{x_1 - b} \frac{1}{x_3 - c} \frac{1}{x_4 - d} \frac{dE_1}{dx_1}
+ \frac{4F(F + 1)x_1^2 + 14x_1 + 14}{4(x_1 - b)(x_1 - c)(x_1 - d)} E_1 = 0.
\]

The operators whose eigenvalues are $l_1$ and $l_2$ are

\[
L_1 = -2aD^2 + 2N_3^2 + \frac{1}{4} \alpha [(P_0 K_3) - (P_3 K_0)] + \frac{1}{2} \delta [P_0 - K_0, P_3 - K_3] = (P_0, K_3),
\]

\[
L_2 = (a^2 + \beta^2)D^2 + \frac{1}{2} \alpha [(P_0 - K_3) + K_0 K_3] + \beta \delta (P_0 P_3 - K_0 K_3)
- \frac{1}{2} \beta [(P_0, K_3) - (P_3 K_0)].
\]

The variables $x_2$, $x_3$, and $x_4$ can assume any real values.

(23) A suitable choice of coordinates is

\[
(z + it) = \frac{1}{R} \left[ \frac{2(x_2 - a)(x_3 - a)(x_4 - a)}{(a - b)(a - c)(a - d)} \right]^{1/2},
\]

\[
x = \frac{1}{R} \cos \phi, \quad y = \frac{1}{R} \sin \phi,
\]

where $R = \text{Re} w - \text{Im} w,$

\[
\omega = \frac{2(x_2 - c)(x_3 - c)(x_4 - c)}{(c - a)(c - b)(c - d)} \right]^{1/2}.
\]

The separation equations in the variables $x_2$, $x_3$, and $x_4$ are

\[
\frac{d^2 E_1}{dx_1^2} + \frac{1}{2} \frac{(x_1 - a)(x_3 - a)(x_4 - a)}{(a - b)(a - c)(a - d)} \frac{1}{x_1 - b} \frac{1}{x_3 - c} \frac{1}{x_4 - d} \frac{dE_1}{dx_1}
+ \frac{4F(F + 1)x_1^2 + 14x_1 + 14}{4(x_1 - b)(x_1 - c)(x_1 - d)} E_1 = 0.
\]

The operators whose eigenvalues are $l_1$ and $l_2$ are

\[
L_1 = -2aD^2 + 2N_3^2 + \frac{1}{4} \alpha [(P_3 K_0) - (P_0 K_3)]
+ \frac{1}{2} \delta [P_3 - K_3, K_0] = (P_3, K_0),
\]

\[
L_2 = (a^2 + \beta^2)D^2 + \frac{1}{2} \alpha [(P_0 - K_3) + K_0 K_3] + \beta \delta (P_0 P_3 - K_0 K_3)
- \frac{1}{2} \beta [(P_3, K_0) - (P_0 K_3)].
\]

The variables $x_2$, $x_3$, and $x_4$ can assume any real values.

(24) A suitable choice of coordinates is

\[
(t + z) = \frac{1}{R} \left[ \frac{(x_2 - a)(x_3 - a)(x_4 - a)}{(a - b)(a - c)(a - d)} \right]^{1/2},
\]

\[
(t - z) = \frac{1}{R} \left[ \frac{1}{(a - b) + \frac{1}{2} \frac{1}{x_1 - a} + \frac{1}{x_1 - a} + \frac{1}{x_1 - a}} \right]^{1/2},
\]

\[
x = \frac{1}{R} \cos \phi, \quad y = \frac{1}{R} \sin \phi,
\]

where $R = 2 \text{Re} [x_1 - a](x_3 - a)(x_4 - a)]^{1/2}.

The separation equations in the variables $x_2$, $x_3$, and $x_4$ are

\[
\frac{d^2 E_1}{dx_1^2} + \frac{1}{2} \frac{(x_1 - a)(x_3 - a)(x_4 - a)}{(a - b)(a - c)(a - d)} \frac{1}{x_1 - b} \frac{1}{x_3 - c} \frac{1}{x_4 - d} \frac{dE_1}{dx_1}
+ \frac{4F(F + 1)x_1^2 + 14x_1 + 14}{4(x_1 - b)(x_1 - c)(x_1 - d)} E_1 = 0.
\]

The operators whose eigenvalues are $l_1$ and $l_2$ are

\[
L_1 = \alpha \frac{1}{4} [(P_3 - P_0 - K_0 - K_3)^2] - (D + N_1)^2]
+ \frac{1}{2} \beta \delta [P_3 - P_0 - K_0 - K_3, P_0 - K_3] = (P_3 - P_0 - K_0 - K_3)
\]

\[
L_2 = (a^2 + \beta^2)D^2 + \frac{1}{2} \alpha [(P_0 - K_3) + K_0 K_3] + \beta \delta (P_0 P_3 - K_0 K_3)
- \frac{1}{2} \beta [(P_0 - K_0, P_3 - K_3) - (P_0 P_3 - K_0 K_3)].
\]

The variables $x_2$, $x_3$, and $x_4$ can assume any real values.
(25) This coordinate system is of similar type to coordinate systems 10 and 11 appearing in Class II. A suitable choice of coordinates is
\[ t = (1/R)\sqrt{(x_1 - a)(x_2 - a)/(a - 1)}, \]
\[ x = (1/R) \cos\phi \sqrt{(x_1 - 1)/(x_2 - 1)/(a - 1)}, \]
\[ y = (1/R) \cos\phi, \quad z = (1/R) \sin\phi, \]
where
\[ R = \sqrt{(x_1 - 1)(x_2 - 1)/(a - 1)} \sin\phi + \sqrt{x_1 x_2/a}, \]
and \( x_1, x_2 < 0 \), or \( 0 < x_1, x_2 < 1 \).

The solution \( \psi \) of the wave equation has the form \( \psi = R\Phi \). The separation equations for \( \Phi = E_1(x_1)E_2(x_2) \times A(\phi)B(\psi) \) are
\[
\frac{d^2E_i}{dx_i^2} + \frac{1}{2} \left( \frac{1}{x_i - a} + \frac{2}{x_i} \right) \frac{dE_i}{dx_i} + \frac{1}{4} \{F(x_1 - 1)\} + \frac{1}{4} \{x_i - 1\} \} \frac{dE_i}{dx_i} + \frac{1}{4} \{x_i - 1\} \} \frac{dE_i}{dx_i} = 0, \quad i = 1, 2. \]
(2.49)

The operators whose eigenvalues are the separation constants are
\[ L_1 = (a - 1)[D^2 + \frac{1}{4}(P_1 - K_1)^2] \]
\[ - \frac{1}{4} \{N_1 + \frac{1}{2}(P_2 + K_2)^2\} + \frac{1}{2}(a - 2)(P_1 + K_1)^2 \]
\[ L_2 = \frac{1}{4}(a - 1)(P_1 + K_1)^2, \quad L_3 = M^2. \]
(2.50)

A suitable choice of coordinates is
\[ t = (1/R)\sqrt{(x_1 - a)(x_2 - a)/(a - 1)}, \]
\[ x = (1/R) \cos\phi \sqrt{(x_1 - 1)/(x_2 - 1)/(a - 1)}, \]
\[ y = (1/R) \cos\phi, \quad z = (1/R) \sin\phi, \]
where
\[ R = \sqrt{(x_1 - 1)(x_2 - 1)/(a - 1)} \sin\phi + \sqrt{x_1 x_2/a}, \]
and \( x_1, x_2 < 0 \), or \( 0 < x_1, x_2 < 1 \).

The solution \( \psi \) of the wave equation has the form \( \psi = R\Phi \). The separation equations for \( \Phi = E_1(x_1)E_2(x_2) \times A(\phi)B(\psi) \) are
\[
\frac{d^2E_i}{dx_i^2} + \frac{1}{2} \left( \frac{1}{x_i - a} + \frac{2}{x_i} \right) \frac{dE_i}{dx_i} + \frac{1}{4} \{F(x_1 - 1)\} \frac{dE_i}{dx_i} + \frac{1}{4} \{x_i - 1\} \frac{dE_i}{dx_i} = 0, \quad i = 1, 2. \]
(2.51)

The operators whose eigenvalues are the separation constants are
\[ L_1 = (a - 1)[D^2 + \frac{1}{4}(P_1 - K_1)^2] \]
\[ - \frac{1}{4} \{N_1 + \frac{1}{2}(P_2 + K_2)^2\} + \frac{1}{2}(a - 2)(P_1 + K_1)^2 \]
\[ L_2 = \frac{1}{4}(a - 1)(P_1 + K_1)^2, \quad L_3 = M^2. \]
(2.52)

This completes the list of coordinate systems of Class III.

Coordinate systems of Class IV

Coordinate systems of this type correspond to the two direct product reductions \( SO(4, 2) \supset SO(2, 1) \times SO(2, 1) \) and \( SO(4, 2) \supset SO(3) \times SO(1, 2) \). In each of these cases coordinates can be chosen from the nine separable classes of orthogonal coordinates on the two-sheeted and one-sheeted two-dimensional hyperboloids and the two separable classes of orthogonal coordinate systems on the two-dimensional sphere. The coordinate systems on these manifolds are given in the Appendix. In classifying coordinates of this type we give the general form of space–time coordinates in terms of the above-mentioned two-dimensional manifolds.

(1) Coordinate systems corresponding to the reduction \( SO(4, 2) \supset SO(2, 1) \times SO(2, 1) \).

A suitable choice of space–time coordinates is
\[ t = \xi_1/(\xi_1 + \xi_2), \quad x = \xi_1/(\xi_1 + \xi_2), \]
\[ y = \xi_2/(\xi_1 + \xi_2), \quad z = \xi_3/(\xi_1 + \xi_2), \]
(2.53)

where \( \xi_1^2 - \xi_2^2 = -1 \) and \( \xi_3^2 = 1 \).

With the exception of coordinate systems of type \( \psi \) (which can always be chosen such that \( D \) is diagonal) there are 16 coordinate systems of this type on the single and double sheeted hyperboloids.

In each case the solution of the wave equation has the form
\[ \psi = (\xi_1 + \xi_2)\phi(\xi_1, \xi_2, \xi_3)\theta(\xi_1, \xi_2, \xi_3), \]
where the functions \( \phi \) and \( \theta \) satisfy the equations
\[ (M_1^2 + M_2^2 + M_3^2)\phi = -(l + 1)\phi, \]
\[ [(P_0, K_0) + D]^2] = -(l + 1)\phi, \]
(2.54)

and \( l \) is a positive integer. The operators corresponding to each of the 16 possible coordinate systems can then be read off from the Appendix, if we make the identifications \( N_1 = \frac{1}{2}(P_1 + K_1), \quad N_2 = D, \quad N_3 = \frac{1}{2}(P_0 - K_0) \) in the case of the \( (SO(1, 2)) \) coordinates.

(2) Coordinate systems corresponding to the reduction \( SO(4, 2) \supset SO(3) \times SO(1, 2) \).

A suitable choice of space–time coordinates is
\[ t = \xi_1/(\xi_1 + \xi_2), \quad x = \xi_1/(\xi_1 + \xi_2), \]
\[ y = \xi_2/(\xi_1 + \xi_2), \quad z = \xi_3/(\xi_1 + \xi_2), \]
(2.55)

where \( \xi_1^2 - \xi_2^2 = -1 \) and \( \xi_3^2 = 1 \).

Again with the exception of coordinate systems of type \( \psi \) there are 64 coordinate systems. In each case the solution of the wave equation has the form
\[ \psi = (\xi_1 + \xi_2)\phi(\xi_1, \xi_2, \xi_3)\theta(\xi_1, \xi_2, \xi_3), \]
where the functions \( \phi \) and \( \theta \) satisfy the equations
\[ (N_1^2 + N_2^2 - M_3^2)\phi = j(\psi + 1)\theta, \]
\[ (-\{P_1, K_1\} + D^2)\phi = j(\psi + 1)\theta, \]
(2.56)
and \( j = -\frac{1}{2} + i q, \) \( 0 < q < \infty, \) for globally defined solutions.

The operator corresponding to the \( SO(2, 1) \) algebra associated with the vector \((\xi_1, \xi_2, \xi_3)\) can be read off from the Appendix with the identification \( N_2 = \frac{1}{2}(P_1 - K_1), \) \( N_2 = D, \) and \( M_3 = \frac{i}{2}(P_1 + K_1).\)

We have looked at four classes of coordinate systems for which the wave equation (\( \star \)) is strictly \( R \)-separable and found 106 distinct such coordinate systems. This adds to the results of Ref. 4, giving a total of 367 inequivalent \( R \)-separable coordinate systems for the wave equation (\( \star \)).

**APPENDIX**

In this appendix we list the orthogonal separable coordinate systems for the two-dimensional, single-sheeted and double-sheeted hyperboloids. In each case we list the symmetric second order operator in the enveloping algebras of the symmetry groups of these manifolds which describes the coordinate system. The coordinates (with the exception of the single-sheet hyperboloid) can be found in the article by Olevski;\(^7\) and equation (\( \star \)).

The coordinates on the single-sheeted hyperboloid \( \xi \cdot \xi = -1 \) are obtained via the substitution \( \xi \rightarrow i \xi \) and \( x_1, x_2 < a; \) \( x_1, x_2 > a. \) The operator is \( L = N_1^2 + aN_2^2. \)

\[
\begin{align*}
(\xi_1 (3) + i \xi_2 (3))^2 &= 2(x_1 - a)(x_2 - a)/(a - b), \\
(\xi_1 (2) - i \xi_2 (2))^2 &= -x_1 x_2/a, \\
(\xi_1 (1) + i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/(a - 1), \\
(\xi_1 (1) - i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/(a + 1), \\
(\xi_1 (1) + i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/a, \\
(\xi_1 (1) - i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/a.
\end{align*}
\]

The coordinates on the single-sheeted hyperboloid \( \xi \cdot \xi = -1 \) are obtained via the substitution \( \xi \rightarrow i \xi \) and \( x_1, x_2 > a; \) \( x_1, x_2 < a. \) The operator is \( L = N_1^2 - aM_3^2. \)

\[
\begin{align*}
(\xi_1 (3) + i \xi_2 (3))^2 &= 2(x_1 - a)(x_2 - a)/(a - b), \\
(\xi_1 (2) - i \xi_2 (2))^2 &= -x_1 x_2/a, \\
(\xi_1 (1) + i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/(a - 1), \\
(\xi_1 (1) - i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/(a + 1), \\
(\xi_1 (1) + i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/a, \\
(\xi_1 (1) - i \xi_2 (1))^2 &= (x_1 - a)(x_2 - a)/a.
\end{align*}
\]
