PHYSICAL AND MENTAL HEALTH ISSUES IN THE TE AROHA DISTRICT

Abstract: Although Te Aroha was considered to be a healthy district, until the early twentieth century it lacked clean water or adequate sanitation. There were justifiable fears of typhus and other diseases being created by these lacks and by the common ‘nuisances’ caused by unsanitary behaviour. Many people had a poor diet, which was normal for men undertaking prospecting far from their homes. For miners, their working conditions were always unhealthy, and miners’ complaint was common, affecting battery hands also.

Medical services remained inadequate until the twentieth century because doctors could not settle for long (for financial reasons) and there was no local hospital. Some doctors, nurses, and dentists visited, but the seriously ill had to be sent out of the district. For injuries, chemists and nurses did their best, as did a dubiously skilled local doctor. Self-medication was common.

Examples are given of breakdowns in mental health, which sometimes led to physical attacks on others or to suicide.

LIVING IN A HEALTHY DISTRICT?

According to Thomas Cecil Bell, who ran a Te Aroha billiard room and later became registrar of dogs,¹ in 1901 he was living in ‘the healthiest town in New Zealand’.² In general, the Te Aroha News agreed, describing the district in 1883 as ‘undoubtedly one of the healthiest’.³ It also argued, in 1910, that early settlers’ good health was explained by their being ‘made of sturdy material’ that kept them active into old age.⁴ In 1897 the level of fitness of a member of the younger generation was noted:

The other day a train left Te Aroha mostly filled with miners on their way to spend the holidays in town. During the trip a young

⁴ Te Aroha News, 20 August 1910, p. 2.
fellow’s hat blew off, and without hesitation he jumped off the train, saved his hat, and succeeded in springing on the last carriage. Smart work, considering the train was going at a fairly good speed.5

This example was misleading, for at the end of the same month another Thames newspaper wrote that there was

a great deal of sickness of a mild form about Te Aroha. The hot weather passed through is beginning to tell its tale, and the local paper says that those who persisted in taking hot baths during the warm weather merely for the pleasure and luxury of the thing, will now find the system run down and below par.6

The climate was blamed for ill health on other occasions, as when, in May 1884, ‘the alternating heat by day and frost at night’ was ‘very trying to those of delicate constitution, and colds and catarrhal complaints’ were ‘rather prevalent’.7

Not all reported illnesses were serious, or sometimes even genuine. Influenza could used as an excuse to avoid work, as illustrated by a Waiorongomai example in 1892: ‘One of the “Micks” working at the tailing mill hit on a good plan to get off early the other night. He pretended to have la grippe [influenza], and got his mate to work half a shift’.8

WATER QUALITY

Serious ill health resulted from impure water and inadequate sanitation, as was recorded as early as May 1881:

We are suffering from the attack of low fever, which seems to be pervading the country from Auckland all through the Waikato and Thames districts. One or two families have several members laid up with it and it has been decided to obtain the attendance of a medical man from Hamilton or Cambridge. It is called scarlet fever here, but whether it is that or the milder form of scarletina, or maybe typhoid, does not appear to be distinctly understood. In

7 Te Aroha Correspondent, Waikato Times, 8 May 1884, p. 2.
all low-lying districts like this too much care cannot be taken to
preserve the sweetness and purity of the water used for drinking.

As this was not being done, the creek supplying

the upper parts of the settlement, being largely impregnated with
the decomposed carcasses of cats and puppies, and with the
sewerage that must drain through the soil - where it is not openly
emptied into the creek - mingled with the soap-suds of the upper
ten on washing days, that are floated down to form the drink of
the lower ten.

Although it was illegal to use the creek as a sewer or for washing,
residents had to drink ‘highly flavoured water, or soap and water
sometimes’, and illness ‘must naturally follow’.9 Waiorongomai had a
similar problem, a correspondent writing in January 1889 of a great
shortage of water, ‘not to hint at the quality of it’. It was ‘a marvel’,
considering ‘the number of cattle, and pigs especially, wandering about the
township, together with fowls, geese and stray dogs’, that the water used ‘in
this tropical weather’ had not caused ‘a serious outbreak of fever’.10

When the first Te Aroha town board was elected in 1887, its engineer
was asked to devise a plan for a water supply.11 Nothing eventuated,
despite prompts that one was needed.12 Private enterprise later took some
action: in 1898, when the Hot Springs Hotel was rebuilt after a fire,
‘pending the establishment of the borough water supply’ a temporary supply
was obtained from the nearby creek.13 Later that year, a borough was
formed. James Mills, the first mayor,14 had made providing a water supply
one of his planks, based on his Lancashire experience.15 Plans were drawn
up,16 and in December a correspondent wrote that ‘we had great excitement
re water supply, but the day was carried by a majority of four. It will be

quite a boon in case of fire, etc’.\textsuperscript{17} Judging from earlier concerns about the dangers of fire in a township built of wood and lacking a water supply,\textsuperscript{18} many residents were more worried about conflagrations than clean water. Although Mills forecast that water would be supplied within six months,\textsuperscript{19} it was not provided until January 1900, just in time, for both tanks and wells had run dry because of dry weather.\textsuperscript{20} Apart from the improved quality and quantity of the water, it proved its worth when a store burned down a year later, when it ‘was fortunate there was a water supply, or it is probably the whole block would have gone. This was the first fire since the introduction of the water supply, which proved of excellent service. With only one length of hose the brigade were able to confine the fire to the store’.\textsuperscript{21}

\textbf{SANITATION}

Sanitation was non-existent when Pakeha settlement commenced. The health needs of Waiorongomai were rarely recorded, although in 1889 Denis Murphy, a miner and farmer,\textsuperscript{22} did warn his colleagues on the county council about the creek running down the middle of Grey Street: unless drainpipes were installed, it would spread typhoid.\textsuperscript{23} At Te Aroha, some settlers’ behaviour was unsanitary, and in its first issue the \textit{Te Aroha News} referred to some ‘low-minded individuals, whom we cannot class as members of the community, have been betraying their filthy nature by committing nuisances in the immediate vicinity of the public baths’,\textsuperscript{24} ‘nuisances’ being a polite euphemism for urination and defecation. As early as June 1881 a Te Aroha meeting asked the government to provide a ‘sum in aid of the public health’,\textsuperscript{25} Two years later, the \textit{Te Aroha News} wanted an inspector of nuisances appointed to improve the sanitation.\textsuperscript{26} As

\end{itemize}
improvements were not made, in 1885 a resident complained about ‘the gutter opposite his door, from which came an unpleasant stench’.27

In April 1886, as there was not even ‘the most embryonic scheme of sanitation’ the county engineer warned of ‘the great need for some sanitary measures’.28 Eight months later, the licensing committee wanted hotels to stop keeping pigs because of the ‘nuisance’ created.29 The following May, the new town board was informed by one of its members that an improvement of the drainage ‘at the earliest possible date’ was an ‘absolute necessity’; he also wanted an inspector of nuisances.30 The following month, the board abolished ‘sunken closets’ and ordered all night soil removed.31 A complaint late in the year about the state of the yard and piggery owned by a coaching company prompted it to authorize the inspector of nuisances to prosecute in such cases.32 April the following year saw a ‘considerable discussion’ about ‘certain nuisances’, the proprietors of the Hot Springs Hotel being told to stop ‘offensive drainage flowing from their premises on to Whitaker Street’.33 Such ‘nuisances’ continued, as for example in 1895, when several residents protested about pigs at a slaughterhouse adjacent to Te Aroha polluting a watercourse.34 The proprietors pleaded guilty to discharging ‘blood and refuse’; being their first offence, they were fined the nominal sum of 5s.35 Pigs continued to be a problem, and were banned from much of the township.36 Dead animals were also a health worry: for instance, in 1900 the poundkeeper was sent a letter expressing ‘strong disapproval’ of his failure to bury some of these as instructed.37

In 1897, a correspondent wanted improved drainage because Te Aroha’s
so-called natural drainage is all very well as far as carrying off rain or flood water is concerned, but in a township that is rapidly growing it becomes a delusion and a snare when refuse and slops are indiscriminately thrown out, generally at the back of dwelling houses, there to putrefy by the action of the sun and air combined, until by degrees fever beds are formed.

Only an ‘efficient drainage scheme’ would prevent typhoid outbreaks.38 A week later, ‘Porcupine’ confirmed the need for improvements:

At present there are six in[ch] pipe drains conveying slops and other offensive matter from other premises abutting on the main street into the water-tables. The latter are flushed by a trickling stream of water conveyed by a small pipe from the creek at the upper end of Kenrick Street. The efficaciousness of the said flushing is counter-balanced by the water-tables becoming silted up in places and forming traps wherein the offensive matter collects. The heat of the sun completes the business by causing decomposition with its attendant unhealthy odours, and when any sickness breaks out we are inclined to raise our hands and exclaim a well-feigned surprise, “Who would have thought it?” The reputation of Te Aroha as a health resort ought to be jealously guarded by its rulers.39

Later that year, when three residents complained ‘about nuisance caused by sewage from another section flowing over theirs’, the board responded that it did not have ‘sufficient funds in hand to do the necessary drainage’ and instructed the inspector ‘to see that no filth was allowed to come into the watercourse’.40 The following March, the local doctor pointed out that the by-law prohibiting ‘sink closets’ was being ignored, creating the danger of an epidemic. He suggested creating a night soil service, the cost to be shared equally between board and householders. The board agreed this was necessary, but delayed action until residents decided whether to form a borough.41

38 Te Aroha Correspondent, Waikato Argus, 27 March 1897, p. 4.
40 Te Aroha Town Board, Auckland Weekly News, 25 September 1897, p. 36.
41 Town Board, Te Aroha News, 19 March 1898, p. 2.
In July, the first borough council agreed to connect the Palace Hotel to a drain to its boundary: ‘only liquid sewage to be allowed to go into the drain’.42 Three months later it agreed to connect the Hot Springs Hotel to the main drain.43 Its owners were praised because ‘every attention has been paid to sanitation, the drainage system - leading straight to the river - being quite equal to that of any town hotel’.44 (But the untreated sewage did lead ‘straight to the river’.)

Finally, in January 1900, sewer pipes were laid in the business section of the town.45 As these transferred the pollution elsewhere, in February a councillor ‘drew attention to the filthy state of the lagoon behind the Court house’; the works committee was ordered to investigate.46 At the subsequent meeting, the same councillor wanted the sewer extended from the Palace Hotel to the river. The ‘swamp’ was ‘used as a dumping ground for decaying vegetable matter of all sorts, also for emptying nightsoil, etc, etc, and it was no use leaving the thing any longer’, for if ‘a fever’ broke out, the council would ‘undoubtedly be to blame’. His proposal was defeated by one vote.47 Councillors then ‘decided that owners of certain Sections in Bridge & Lipsey Sts be notified that a drainage nuisance must be stopped’.48 Extending the drainage to the river was supported by the Te Aroha News, for the sewer emptied into a quarter-acre swamp which it described as an ‘open cesspool’ right in the heart of the township. If typhoid occurred, who would come to Te Aroha for their health, as encouraged by the domain board?49 The subsequent council meeting re-litigated extending the sewer to the river, with the same outcome, but decided to extend it six months later, funds permitting.50

Presumably as a result of these concerns, prompted by a fear of bubonic plague that was causing people in Auckland and elsewhere to kill rats, an unknown person played a practical joke. ‘People going to the Te Aroha post office the other day were scared by noticing in the middle of the road a dead mouse, close to the prostrate form of which was fixed a 12 x 8 in[ch] flag bearing the words, “Beware of the Plague”’.51 That dead rodents sometimes littered the township was indicated by the demand by the local newspaper a few years later that ‘the practice of killing rats and leaving them in the streets to rot’ must cease because it would drive away tourists. ‘The other day three of these rodents in a high state of putrefaction were lying on the roadway opposite the Domain entrance, and the smell arising therefrom was something awful’.52

During 1901 plans were made to improve drainage to the lagoon and on to the river, but in November councillors were informed that ‘Health Officers had refused to sanction nightsoil drainage going into the river, as part of any new scheme’.53 In January 1902, the council sought information from various local bodies about how to deal with nightsoil.54 Three months later, when the district health officer advised it to apply for a government subsidy to improve drainage and construct a septic tank, it agreed to apply when it had sufficient funds, in the meantime hoping its night soil system met ‘present requirements’.55 An Auckland sanitary inspector inspected the sewers emptying into the river in mid-year, with the object of replacing them with septic tanks.56 After this visit, the district health officer reported on the lack of action:

This town might be, from its natural advantages, a very perfect little health resort. Beyond a good water supply, however, very

56 Auckland Weekly News, 26 June 1902, p. 28.
little has been done. There is no nightsoil service or refuse removal, and drainage is very incomplete in most places. Two sewers connect the hotels and sanatorium with the river, which is already beginning to show signs of pollution. The offer of a subsidy from the Government for the purpose of erecting a septic tank to remedy this was met with a reply that the Council could not afford it, but were “contemplating a nightsoil service.” I fear they have become so lost in the contemplation of this hypothetical scheme that they fail to grasp the fact that to be a health resort they must strive to do a little more than a backwoods township as regards sanitary matters.57

One correspondent considered the last comments were unfair, for the borough’s revenue was ‘very small’ and it already had ‘a healthy overdraft’. Although data was being sought about a nightsoil service, a decision was delayed largely ‘through the neglect of persons and bodies applied to for information to reply with promptitude’.58 That month, the council did agree to institute such a service at a cost of 4d per pan per week, and forbade pigs being kept within the area serviced.59 After a resident was discovered ‘burying nightsoil on his section in manner calculated to cause a nuisance’, he was warned of prosecution if this continued, and this practice was banned within the sewered area.60

As contractors collected night soil only once a fortnight,61 sanitary problems persisted. In March 1903, the works committee reported a ‘nuisance arising from open drains in the locality of Te Aroha Boardinghouse. Drainage from several premises was flowing into these, and a serious nuisance existed’. It was decided to devise a scheme to solve this problem.62 In late 1904, it accepted the recommendations of the Public Works Office that more drainpipes be installed.63 Problems continued,

60 Te Aroha Borough Council, Minutes of Meetings of 17 December 1902, 25 February 1903, Minutes of Meetings 1898-1911, pp. 158, 166-167, Matamata-Piako District Council Archives, Te Aroha.
‘Visitor’ writing in 1908 that filthy drains were causing cases of fever and urging that these be cleaned, for tourists came to Te Aroha to escape sickness.\(^{64}\) A month later, the local newspaper was ‘asked to draw the attention of the authorities to the almost unbearable stench at times arising from the open drain running down the upper side of Whitaker-street’.\(^{65}\) The following month, it gave further details about the bad drainage.\(^{66}\) In future years, not covered, the disposal of sewage and other pollutants had to be improved further, in the interests not only of health but because dairying required clean water.

One last sanitary problem to mention: in 1902, ‘A Lover of Clean Streets’ complained about a ‘dangerous and filthy abuse. On Saturday last I went out to do some shopping, two shops I wanted to enter, but could not owing to the disgusting state of the pavement. It would have been like walking through a huge spittoon’, and he wanted an inspector ‘who would fear or favour no one. There is ample work for such a man’.\(^{67}\)

**TYPHOID**

Fears of contracting typhoid fever from impure water were realistic, not alarmist. In the South Island goldfields in particular, a lack of clean water caused ‘low fever’, assumed to be a form of typhoid.\(^{68}\) On 1 March 1883, after a three-week illness, William King, a miner aged 42, died at Waiorongomai from this disease.\(^{69}\) Exactly one year later, a farmer, John Quin, died suddenly in a hotel. ‘He arrived here a few weeks ago, and went to work in the Colonist mine, but was shortly afterwards taken ill. The cause of his death was fever induced or aggravated by the fumes of dynamite or some other explosive used in mining’.\(^{70}\) According to his death certificate, the cause of death was typhus, from which he had suffered for 18

days.\textsuperscript{71} In 1887, Abraham Mason Wainwright, an early settler in the district,\textsuperscript{72} after an illness of only 20 hours died of typhoid.\textsuperscript{73} Ten years later, Reha Aperahama, a Ngati Rahiri rangatira,\textsuperscript{74} died of typhoid after eight days.\textsuperscript{75}

Because rumours of typhoid were bad for the tourist trade, in 1902 a correspondent rebutted a Hamilton report of a typhoid epidemic. There had been no infectious diseases during the past year apart from two mild cases of scarletina; for ‘a health resort’ such reports were ‘likely to do much harm’.\textsuperscript{76} Three years later, when a resident did have typhoid, the local newspaper argued he might have contracted it in Auckland.\textsuperscript{77}

\textbf{SCARLET FEVER}

In May 1881 an outbreak of scarlet fever caused residents to be ‘much alarmed’. It had ‘attacked the child of a storekeeper’, and it was feared that other family members would be infected. One resident sent his children to Thames to ‘be in safety’.\textsuperscript{78} There was initial uncertainly about the nature of the disease, one correspondent describing children suffering from ‘low fever, which, though hardly perhaps typhoid’, was ‘of a somewhat similar character’.\textsuperscript{79} A doctor was brought from Hamilton, for nearly all the children in several families were feverish, but they recovered quickly and the disease did not spread as feared.\textsuperscript{80} After his visit, there still remained ‘a good deal of sickness’ amongst children, but ‘in the absence of a medical man’ it was ‘difficult to determine its nature’.\textsuperscript{81} When the 15-year-old son of a miner died after an illness lasting 14 days, the cause of death was

recorded as scarlet fever.82 One correspondent reported it was ‘presumed’
that he had scarletina, ‘but had apparently got better, and his death may be
attributed to the weakness induced by the disease’.83

James Beattie, a miner,84 caused a panic in July: because of fears that
he had scarletina or possibly diphtheria, he was sent to the Thames hospital,
which refused to admit him because of fear of infection before discovering he
had quinsy or inflammation of the tonsils.85 It seems poverty was one cause
of his ill health:

The man had been ill for some five or six weeks, and was living in
utter destitution by himself. A storekeeper here had found him
the means of living, and a working woman had charitably nursed
him. As he got weaker, Dr Harvey was asked to see him, and
finding that he was, though still suffering from the after effects of
scarlet fever, in more danger from want of nourishment and
nursing than from the illness, he said merely in the spirit of
humanity that the best thing to do would be to try and get him to
the hospital.86

Diet

Susceptibility to disease may have been heightened by poor diet.
Prospecting and mining in new or distant fields in any country meant
supplies of fresh food, especially fruit and vegetables, were often
inadequate, creating health problems.87 On another field one man lived on
bread and tea for over a week, and lack of fruit and green vegetables caused
scurvy.88 Tasmanian prospectors carried flour and a raising agent to make
damper, the other ‘essentials’ being bacon (because it cooked in its own fat),
tea, and sugar.89 A rifle was carried to shoot game, and fish were caught.

89 Nic Haygarth, ‘The “Father of Tasmania”?: Measuring the legend of James “Philosopher”
Reputedly “Philosopher” Smith, the famous Tasmanian prospector, had ‘a portion of biscuit and a pannikin of tea or water’ for breakfast and could survive for days on brown sugar and water. Australian miners in the 1850s had a high energy, high protein diet which was rather deficient in fresh vegetables and dairy products. Every meal included plenty of bread, steak or mutton fried in fat, and tea, although some preferred coffee for breakfast. Plum pudding was a special Sunday treat. The meat provided the necessary calories for hard labour. A Victorian digger described breakfast as ‘eternal chops’ cooked on a frying pan and ‘placed on a lump of bread’, accompanied by ‘scalding tea’. ‘Dinners’ were taken to the claim along with ‘the travelling pot of tea’, the midday ‘hasty meal’ requiring both pannikin and pipe.

After a hard day’s work one is not disposed to be too particular about the evening meal, and the mode in which it is prepared. Something has yet to be done. The morrow has claims. The damper is eaten. Taking a washing tin dish, and clearing off the dirt a little, six or eight pannikins of flour are thrown in; a half tablespoonful of carbonate of soda, and like quantity of tartaric acid, and a spoonful of salt are mixed together in a pannikin, and then well mingled with dry flour. Water is then poured in, the whole thoroughly knuckled, rolled into a good shaped loaf, and tumbled at once in the warmed camp oven. Fire is applied beneath and above the oven in a way to insure uniform heat, and a couple of hours or less will turn out a loaf fit to set before the queen. Saturday afternoon and Sunday morning are especially consecrated to cookery. The same camp oven has, perhaps, to turn out two loaves, a baked joint for dinner, and, mystery of mysteries, a boiled plum pudding in the bargain. Add to all this, potatoes, when you can afford to pay for them, not forgetting a few boiled onions, should you chance to boil in your oven a leg of mutton.

Some men did not take the time to make bread, being content with ‘dry or flat Johnny cakes, which are simply of flour and water, or with the addition of greasy accumulation of cookery, hastily prepared in the frying

pan. Many lose health by inattention to meals’. 94 When walking to Coolgardie, in Western Australia, during the 1893 rush, a young digger carried in his swag ‘twenty pounds of provisions – the same old flour, oatmeal, tinned meat, sugar, tea and tobacco’. 95 The flour was used for damper and johnny cakes. 96 The only food some prospectors carried across the desert were flour and ‘tinned dog’, 97 the colloquialism for tinned bully beef. 98

A Swedish prospector exploring the Grey River valley on the West Coast in 1866 and 1867 told his family that ‘food was scarce, containing only bad bacon, oatmeal, tea and sugar’. 99 When out in the ‘wild forest’ where ‘meat was not to be had’, he ‘managed to catch another wild hen or sometimes fished an eel’. 100 An account written by an early West Coast miner noted cases of scurvy caused through ‘too much salt provisions, without making use of vegetables of any kind to relieve the system’. Miners returning to the townships commonly suffered from diarrhoea, ‘often brought on by a sudden change from coarse, hard diet, to rich and abundant living, together with the use of liquor’. 101 In 1863, Otago prospectors took flour, dark brown sugar, ‘side meat’, and black tea. 102 An American prospector found all foodstuffs to be expensive, and when a butcher killed a beef the meat was cut into pieces of five to ten pounds to suit himself. If you wanted a steak he wouldn’t sell it to you. You

had to either buy one of those “chunks” at 32 cents a pound or go without. A working man without meat will eat 18 pounds of flour a week, and with meat 11 pounds will suffice.103

In 1862, the provisions the Auckland provincial government provided for prospectors comprised flour, potatoes, salt beef, salt pork, tea, sugar, and tobacco.104 A later prospector, Billy Nicholl, who discovered the Martha lode at Waihi,105 had a poor diet on several goldfields, claiming to have lived ‘on damper and black tea for six months’ at Coromandel; any income was spent on ‘flour, tea and sugar and tobacco’.106 ‘A good blow-out’ was a meal of ‘bread and cheese and bacon’ washed down with tea.107 When a baker, David Snodgrass,108 later to acquire an interest in a Waiorongomai claim,109 became a sleeping partner with a one-tenth interest in a Thames one in 1868, the terms of the agreement required him to supply provisions for the two working miners for two months. Each week, they were to receive one pound of coffee, 14 loaves of bread, four pounds of sugar, seven pounds of meat, and two pounds of butter.110 When some men prospected Ohinemuri in the late 1860s, their food consisted of ‘tea, flour, sugar, bacon, oatmeal, biscuits, sardines etc’.111 This was typical: when later working on a farm, one of them lived mostly on ‘tinned meats and damper’, along with tea and

tobacco, causing his health to suffer.\textsuperscript{112} A Thames miner recorded in November 1867 that one of the ‘annoyances’ of the new field was ‘a deficiency or total absence of all vegetable food’.\textsuperscript{113} Some shopkeepers quickly acted to solve this deficiency, for a week later he mentioned a greengrocer (and his death).\textsuperscript{114} But financial difficulties meant some miners could not avail themselves of a better diet. ‘One fine muscular man said, in a melancholy tone … that for the last month he had tasted nothing but dry bread and weak coffee. It was manifestly telling upon his manly frame terribly, yet he went on, hoping that the gold would soon appear and set him right’.\textsuperscript{115} Even though better food was available on the Hauraki fields, many could not afford to purchase it, subsisting instead on tea and biscuits.\textsuperscript{116}

John Walsh, a pioneer of the Te Aroha rush,\textsuperscript{117} died from ‘serious apoplexy’, aged 40, 16 days after leaving the district for the Tiki goldfield.\textsuperscript{118} The inquest was told that on the evening before his death he had eaten bread, butter, and coffee.\textsuperscript{119} Six years later, at Maratoto, a miner provided a visiting journalist with a breakfast of steak, bacon, eggs, bread, and tea.\textsuperscript{120} On the same goldfield in the following year, John Hoey Moore,\textsuperscript{121} a mine manager during the Te Aroha rush,\textsuperscript{122} provided another journalist with two meals. The evening repast was described as ‘a good meal of corned beef and “spuds,” and the never-failing “billy” of tea near at hand’. For breakfast he had a ‘hearty meal of stewed pigeon’.\textsuperscript{123} At Karangahake ten years later, an

English visitor described chatting with miners ‘after a good dinner of tinned mutton and tea’.  A miner living near the Waiorongomai mines took a pig to his home in 1889, presumably for butchering.

Possibly some of these meals included fruit and vegetables, either grown or purchased. Once settlements were established, miners’ families planted gardens and fruit trees and kept chickens and cows. When Waihi was established in 1881, one party of miners had over an acre ‘ploughed up and planted with vegetables in order to supply the necessities of the miners’. By then, Chinese market gardeners were well established at Thames. At Waiorongomai, the only provisions advertised as being packed up-hill were meat, bread, and unspecified groceries. In March 1882, ‘A Miner’ visiting the Army claim was given ‘some tea, bread, and beef’ for lunch. At the Eureka he had an unspecified ‘good supper’ and breakfast, and at the Golden Crown (later the Premier) an evening meal of ‘good steak and tea’. Vegetables were certainly available: in 1886 and for some years later ‘a couple of Chinamen’ had a garden on George Lipsey’s farm ‘in a very high state of cultivation’, supplying ‘vegetables of every description’. When the Waiorongomai tramway was being constructed, it was suggested it would be made more speedily if the workers were given ‘more beef and less cabbage’. Although a ‘kitchen garden’ was started ‘in connection with the hill store’ at Quartzville in 1882, the only account of food being eaten in its vicinity did not mention its produce. This was in February 1883, when a journalist visiting the New Find at lunchtime was given ‘sundry pannikins of tea, some bread, butter, &c’.

In addition to commercially available produce supplied by nearby farms, homes commonly had gardens and small orchards. Produce displayed at the Te Aroha Horticultural Society’s first show in 1895 included grapes, apples (12 varieties), peaches, pears, plums, quinces, rhubarb, watermelons, rock melons, pie melons, broad beans, kidney beans, carrots, cucumbers, tomatoes, cabbages, onions, parsnips, pumpkins, marrows, beetroot, potatoes, and squash. Home cookery included jams, bottled fruits, jelly, and tomato sauce. Eggs were classified with milk, butter, cheese as ‘dairy’, and there was ‘a fine sample’ of homemade wine. All this produce was judged in 1900 plus nectarines, apricots, mulberries, strawberries, peas, a ‘long red’ variety of carrot, turnips, Savoy and red cabbages, lettuces, other varieties of onions and potatoes, shallots, leaks, radishes, parsley, dried apples, peaches, and hops, and pickles.

The bread and butter that was the basis of most meals was not only inadequate for a physically demanding occupation like mining, but also, according to the Rev Vicesimus Lush, of Thames, inadequate for his occupation as well. In 1879, he complained about the food he received when staying with John Phillips, a Paeroa storekeeper who had recently built a large house, which implied a successful business. Whilst ‘hospitably entertained’, Lush lamented that on the first night he was given ‘only bread and butter for tea - no meat! And, bread and butter for breakfast and Ditto repeated for tea, and no nice supper to make up for it, was rather hard on me after a toilsome day’s work’. Only when departing late the next morning was he given a piece of cold chicken.

Other food must have been eaten, certainly when miners living on the hillside spent part of their weekends in the settlements. Sometimes food was dangerous, as in 1894, when a Te Aroha settler gave honey from a hive in his garden to his neighbours:

135 *Te Aroha News*, 9 March 1895, p. 2.
137 See *Thames Advertiser*, Ohinemuri Correspondent, 10 July 1876, p. 3, 7 October 1876, p. 3, 23 August 1878, p. 2, 29 August 1878, p. 2, 10 April 1879, p. 3; *Cyclopedia of New Zealand*, vol. 2, p. 853; *Ohinemuri Gazette*, 29 July 1903, p. 2, 5 August 1903, p. 2, 12 August 1903, p. 3, 15 September 1903, p. 2.
Only a few hours afterwards nearly all who had partaken of the honey were taken very ill with fits. Mr Hall’s children were especially bad, and for some time were scarcely expected to live. A young man named Earl was also very bad. Altogether, about four adults and five children have suffered from the poison. Dr [Charles Alfred] Cooper and Mr [George] Robson, chemist, did their best for the sufferers, and all are now recovered. The honey taken was unsealed, and in that state is said to be poisonous.

The previous year there had been a report from Thames of a miner’s family poisoned, again not fatally, by wild honey.

Restricted diets were not unique to miners. When Herbert Guthrie-Smith first arrived at his Tutira station, near Napier, in 1882, the previous owner prepared an evening meal of bread and salt pork plus the ‘luxury’ of flapjacks. Guthrie-Smith and his partner lived on ‘spartan fare’ during the 1880s: ‘bread, mutton, potatoes, duff’. ‘We cooked for ourselves; we lived on porridge and water, bread baked in camp ovens – there is no better bread in the world’, along with the ever-present ‘mutton, potatoes, and duff’.

Such a diet made men with sedentary occupations overweight. For example, when mining agent and sharebroker, Samuel Turtle, who invested in two Waiorongomai claims and two companies, died, the coroner described him as a ‘very large man’, being 15 stone. When

Charles Ahier, an accountant at Te Aroha during the 1880s and 1890s,\textsuperscript{149} contemplated ‘making an excursion to the summit of Mount Gentle Annie’, otherwise Te Aroha, a gossip writer feared he would ‘not reach that far without the aid of a steam winch and a ship’s cable’\textsuperscript{150} Patrick Quinlan, a publican at Te Aroha during the 1880s and later in Auckland,\textsuperscript{151} by the early twentieth century weighed 17 stone, prompting jocular comments and cartoons about his size.\textsuperscript{152} With one exception, no prospectors or miners were overweight. Karaka Kamura, a part owner of claims at Te Aroha before he assisted Hone Werahiko\textsuperscript{153} to prospect Waiorongomai,\textsuperscript{154} was ‘very stout’ nine years later, when aged 36.\textsuperscript{155}

THE UNHEALTHY LIFE OF MINERS

According to Edward Wakefield in his 1889 book praising all things New Zealand, prospectors were remarkably fine physical specimens able to triumph over all adversities:

An experienced New Zealand digger, in the prime of life, is just about as fine a specimen of humanity as is to be found anywhere. He can walk or ride, or climb, or swim, to almost any distance, carrying a “swag,” that is to say, a compact pack, containing all his baggage and utensils, rolled in his blankets or tent, and weighing enough to have crushed a Roman legionary. And neither

hunger nor thirst, fatigue nor suffering, solitude nor danger can keep him from the goal that he has before him.\footnote{Edward Wakefield, \textit{New Zealand after Fifty Years} (London, 1889), p. 169.}

In contrast, eight years previously an Auckland newspaper had quoted statistics proving the average life of a miner was ‘ten years shorter than the generality of occupations’.\footnote{\textit{New Zealand Herald}, 27 April 1881, p. 5.} Hone Werahiko and Adam Porter were examples of lives being shortened by hardships they endured, the former when prospecting at Waiorongomai and the latter when building a water race on the West Coast.\footnote{See \textit{Cyclopedia of New Zealand}, vol. 2, p. 861.} Another example was Thomas Radford, a leading mine manager at Thames,\footnote{Te Aroha Warden's Court, Register of Licensed Holdings 1881-1887, folios 2, 47, BBAV 11500/9a, ANZ-A; \textit{New Zealand Gazette}, 10 August 1882, p. 1101.} who invested in Waiorongomai mines in 1882,\footnote{\textit{Thames Advertiser}, 7 June 1890, p. 2.} whose careers in mining and in local government were curtailed by illnesses. In June 1890, the \textit{Thames Advertiser} was ‘glad’ to see him ‘able to walk about again after his severe illness’, although he was ‘still suffering from bronchitis’.\footnote{\textit{Thames Advertiser}, 25 June 1890, p. 2.} Later that month, he resigned as manager of the Alburnia ‘owing to indifferent health’,\footnote{\textit{Thames Advertiser}, 23 February 1891, p. 2, 4 March 1891, p. 2.} and in the following year he resigned almost immediately after being appointed to manage another mine.\footnote{\textit{Observer}, 16 October 1891, p. 7.} The \textit{Observer}, commenting on his forced retirement, wrote that ‘a casual observer’, looking at his ‘colossal form and genial, rotund features, would consider him the last man upon whom Dame Nature would call to relinquish his situation owing to the fickleness of his health’.\footnote{\textit{Observer}, 16 October 1891, p. 7.} A year later he became manager of the Alburnia once more and then supervisor of the Orlando, but late in the year another manager had to supervise the former during his ‘indisposition’.\footnote{\textit{Thames Advertiser}, 20 May 1892, p. 2, 13 October 1892, p. 2, 10 November 1892, p. 2, 19 November 1892, p. 2; \textit{Observer}, 4 June 1892, p. 16.} When obliged by his health to resign from it once more, ‘Obadiah’ anticipating that this would be the last time that he would be a manager.\footnote{‘Obadiah’, ‘Shares and Mining’, \textit{Observer}, 26 November 1892, p. 14.} Nevertheless, from 1893 to 1896 he was able to
manage five other mines, although obliged to visit Te Aroha because of his health late in 1896.\textsuperscript{167} Chairing a public meeting in mid-1896 that discussed how to find work for unemployed miners, he referred to himself as ‘a miner, of fifty-two years standing, and an unemployed one too (Laughter)’.\textsuperscript{168} From 1900 onwards, he resigned from all his public offices because of being seriously ill.\textsuperscript{169} He died, aged 74, in 1907, after suffering for three years from ‘cardiac degeneration’.\textsuperscript{170}

Working in wet mines often made miners susceptible to rheumatism. Writing about the Hauraki fields in 1896, one observer noted that as ‘miners, and others employed in mining’ were ‘often martyrs to rheumatism’, they patronized the Te Aroha hot springs.\textsuperscript{171} Daniel Ennis O’Sullivan, a 40-year-old miner soon to try his luck at Waiorongomai,\textsuperscript{172} was admitted to the Auckland hospital on 30 September 1879 suffering so badly from rheumatism that he was not discharged for one and a half months.\textsuperscript{173} Peter Martin, a miner who participated in the Te Aroha rush,\textsuperscript{174} had earlier participated in the Thames rush,\textsuperscript{175} and in 1875 had a claim at Waitekauri,\textsuperscript{176} in the latter year was unable to work for four months

source of annoyance to the men, but at present they are not troubled on that account owing to the reef being more compact’. 189 In the Premier, in February 1896, there was ‘a large flow of water from the face of the drive’ in the lower level. 190 On the northern drive on the reef in the low level of the Cadman, driven in the late nineteenth century, 191 miners tried to cope with a water problem by erecting a corrugated iron roof over the face. 192

Mining was the sole cause of some medical problems. James Williams, who won second prize in an essay competition held by the Mines Department in 1906, included remarks about the ‘general health’ of the goldminer:

Quartz-miners appear to tire easily, both mentally and physically. Public movements in mining districts flourish a little while and then die out. The practical miners attending the schools of mines are the least assiduous at their studies. Miners, as a rule, are not inclined to athletic exercises. On returning home from their work they are generally less ready for domestic chores than other members of the working-class. Unless called out by business or social engagements, they usually sit about till bed-time in their digging-clothes. They often complain of headache and palpitation. Generally they are pale, and move slowly; but a week’s holiday improves them marvellously. They soon revert, however, to their former condition. 193

GAS AND FUMES

Although Williams believed miners’ paleness might result from working underground, he considered their headaches and fatigue were the product of ‘gaseous poisoning’ caused by carbon monoxide being produced by nitro-glycerine explosions. Should the ground be wet, or detonation imperfect, the amount of gas produced could be ‘considerable’. 194 Thames

mines were notable for the amount of gas produced: one visitor to the Moanaataiari mine in June 1880 noticed ‘large quantities’ of gas, which ‘frequently put out my candle’ when he lowered it to his knees. As the mines were ‘well supplied by top air’, the heavy gases flowed out ‘like water’.\(^\text{195}\) One man who mined, occasionally, at Thames, recalled that ‘working in the shafts was most arduous, as you were often up to your knees in water… The air in the shafts was also generally pretty bad, and I felt sometimes as if I could float to the top, through being so filled up with gas’.\(^\text{196}\) At Te Aroha gas was a problem only at Tui, and was only mentioned when Norpac mined there.\(^\text{197}\)

A visitor to Waiorongomai in 1884 noted that the ‘hard and wet ground’ required the use of dynamite, ‘the deleterious fumes of which’ were ‘slow death to some men’.\(^\text{198}\) Bert McAra, mine manager at Tui in 1949 and later a mining inspector, in his account of mining at Waihi noted that before the introduction of gelignite in the 1890s the usual explosive was dynamite. ‘It had the serious disadvantages of being extremely sensitive when frozen, and of producing strongly irritant fumes’.\(^\text{199}\) He also noted that nitrous fumes given off by nitro-glycerine explosives caused ‘headaches and sickness after more than a few minutes’ exposure. The condition known as “gelly head” (severe prolonged headache) was caused by absorption of nitro-glycerine through the skin’.\(^\text{200}\)

As the effects of bad air were well known, some efforts were made to counter them at Waiorongomai. In November 1883, the manager of the Canadian planned

\[
\text{to make a fanner at the mouth of the drive to carry air into the face to drive out the dynamite fumes, which are very injurious to the working men, and under existing circumstances are the cause of a great loss of time, the men having to wait for a quarter of an hour for the smoke to clear out of the drive.}\(^\text{201}\)
\]

\(^{197}\) See paper on Norpac and pollution.

\(^{200}\) McAra, p. 328.

\(^{201}\) New Zealand Herald, 22 November 1883, p. 6.
It was not reported whether this was in fact done. In the New Find, in 1885, a contractor complained that wages men using dynamite ‘caused the air to become so foul that they could not oftentimes work above half time at their contract’. The manager responded that the air was better after his men worked nearby ‘owing to an additional steady supply being provided by means of a water blast specially erected in addition to fan’. In 1896, the Premier installed ‘a furnace draught, with pipes carried into the main drive and crosscut’, which kept the workings ‘fairly clear’. Compressed air was primarily used to drive rock drills.

Fumes were also a problem when treating the ore. In 1888, for instance, when changes were made to the tailings plant, the sand, after leaving the roaster, was ‘spread on the concrete floor’ and ‘allowed to cool naturally, thus getting rid of sulphur and other noxious gases’ that were ‘considered so deleterious’ in saving gold; the emphasis was on successfully treating ore, any benefits to the battery hands’ health being incidental. Using mercury and cyanide in batteries also endangered health.

Charles Manuel illustrated the consequences of being gassed. According to his own account, he had been involved in mining since the age of nine, first being associated with Waiorongomai in 1909. His health was then still seriously affected by having been gassed in the Caledonian in Thames in April 1886. Manuel, a shift boss, with other volunteers had attempted to rescue two miners overcome by carbonic acid gas and had brought their bodies out. For this act he received a medal from the Royal

Humane Society, but for the next two years his health was critical. Doctors expected him to die, but when informed of this his 'courage and spirit asserted itself, and he resolved to leave the hospital and return to his home'. This was in 1887, when he spent 42 days in hospital after coughing up blood, being finally discharged 'relieved' but not cured. He would die, suddenly, aged 62, in 1914, when a cough broke a blood vessel in a lung.

WOUNDS

McAra noted that septic wounds caused 'many disabilities and much lost time. Injuries to hands and even loss of fingers were a high risk in work with sharp quartz boulders. The underground conditions of warmth and humidity practically ensured that any such wound would be infected', requiring weeks in hospital. As an example of this, when one miner, James Gordon, injured his finger in the Talisman in 1913 he had to take 48 days off work.

The battery was also a dangerous place, although not many accidents were recorded. In 1894, a man working in the Waiorongomai battery was rushed to the Hamilton hospital after 'his trousers were caught in the cogwheel of the amalgamator, and his leg was drawn in and severely crushed and lacerated, though fortunately no bone was broken'.

MINERS' COMPLAINT

The greatest health hazard was miners' complaint, otherwise referred to as miners' phthisis, silicosis, or pneumoconiosis, the latter sometimes

being recorded as pneumonoconiosis or pneumoconiosis. This variety of names used on death certificates for this disease makes accurate statistics difficult.220 Disasters attracted public attention because men died quickly, whereas this disease ‘passed unnoticed’ despite killing ‘many more workers slowly’.221 This chronic lung disease was ‘known variously as mining disease, miner’s consumption, miner’s phthisis or, quaintly, the disease of worn-out miners’.222

Miners’ phthisis ‘is a general term for silicosis, tuberculosis or a combination of both’, and pneumoconiosis is ‘the term which covers all lung disease caused by dust or fibres, including silicosis’,223 the latter being caused by inhaling sharp particles of silica dust. Although ‘not usually in itself a life-threatening disease … its presence predisposes miners to other lung diseases, particularly tuberculosis’.224 Geoffrey Blainey described its effects:

In quartz mines the fine particles of silica slowly damaged men’s lungs and bronchial tubes. Such men continued to work vigorously for years, then got a recurring cough and mild bronchitis. They had to spit, a complaint popularly called the black spit. In time they were short of breath and tight in the chest and reluctantly retired from the only living they knew…. Their weak lungs were now vulnerable to tuberculosis. The tubercle germ spread rapidly in the quartz mines, for many men in the first stages of the miner’s disease passed on the germs by spitting or by shouting close to their mate’s face in order to be heard above the roar of the rock drill.225

McAra described its symptoms as generally taking

the form of increasing shortness of breath, as the effective area of the lungs was reduced through destruction of the tissue and blockage of the minute air sacs, reducing the quantity of oxygen which could be absorbed into the bloodstream. Distress increased in severity through the poisonous chemical effect of the fine silica on the tissues, as well as the strain caused through loss of lung capacity, until eventually severe and fatal haemorrhaging occurred.\textsuperscript{226}

For long, this disease was held to be an inevitable consequence of mining.\textsuperscript{227} Quartz mining and milling released clouds of silica dust,\textsuperscript{228} which miners could not help but inhale. Until the 1890s, its nature was poorly understood, although there was some recognition that it was exacerbated by dust, especially from pneumatic drills. Some believed that ‘the strong smell of explosive fumes was responsible’.\textsuperscript{229} Diagnosis was handicapped because ‘systematic symptoms of the disease often did not make an appearance for some years after the miner’s exposure to dust’.\textsuperscript{230}

Williams wrote that ‘no observant man’ could ‘fail to have noticed the comparative youth of the superannuated quartz-miner. Fifteen years would seem to be about the average length of an underground career - twenty years would be exceptional’. He was referring to miners continuously working underground, not those with part-time occupations. ‘Five years’ constant employment on machine drills’ was ‘more than most men could stand’:

This is not intended to convey that the miner necessarily dies at the end of this time, or even that he is permanently confined to his bed. But neither must it be taken that although unfitted for mining he is still able to do a day’s work “on top,” for, on the contrary, a climb up a fairly steep flight of stairs is beyond him; any continuous work, of course, also; nay, even a hearty laugh will turn to a body-racking fit of coughing. In his own parlance, he is “cooked.” Every man of forty or so that one sees in a mining district halting and fighting for breath on a gentle rise, or staggering under a burden of which a strong fourteen-year-old

boy would make light, is an indictment against the quartz-mining industry as at present conducted.  

A miner ceased to work underground when he felt he had miners’ complaint. ‘By dint of help from his relatives and friends, and with a little work from public bodies’ he managed ‘somehow to “rub along”’. He was not normally ‘confined to his bed till the last bout’, which might last two years, but his sufferings were ‘usually considerable’. He often contacted ‘some other pulmonary complaint’, which would be registered as the cause of death.  

Blainey explained why mechanical rock drills ‘intensified the fine dust in the mines. Its drilling speed created far more dust than the old hand drills that were hammered into the rock with the slow blows of a miner’s hammer’, and one drill was named ‘the widow maker’. It was more difficult to ventilate deep mines, ‘and often no current of air blew away the dust from dead ends where men worked’. When three eight-hour shifts were used, this ‘gave the dust only Sunday in which to rest and settle’.  

A doctor told a hearing of the conciliation court in 1901 that ‘once the disease was contracted there was no hope of a recovery’, the affected man living for about another five or six years. Examining cases of miners’ complaint at Waihi, McAra considered that, ‘while numbers of these men had sufficient lung damage to render them unfit for work, their lives were not greatly shortened’. As the disease was aggravated by tuberculosis, he judged that it was difficult to assess the part it played in many of the deaths. However, the effect of quartz-dust on the lungs - whether through its sharp nature, its extreme fineness, or its chemical reaction with the tissue - was many times worse than that of ordinary rock dust and phthisis was undoubtedly responsible for substantially shortening the lives of several hundred men at Waihi and Waikino.

Battery hands were as susceptible as miners. According to the *Observer*, whilst a miner’s life was ‘not an enviable one’, working in a big battery was even ‘less pleasant’. In the Waihi battery in that year, 1896, the ‘fatal particles’ known as ‘Waihi dust’ had ‘carried off more than one fine, strong young fellow to an untimely grave’.237 Dry crushing, according to Percy Morgan, director of the Waihi School of Mines, meant a dust-laden atmosphere ‘not only at the stamps, but also at the rock-breakers, in the kiln drives, and in the treatment plant. In order to prevent the dust from injuring the battery employees, numerous expedients were tried, but none were altogether successful’. For several years dust prevention ‘was taken up somewhat half-heartedly’ by most managers, ‘probably from a failure to realize the serious nature of the case’. Only after parliament required ‘adequate dust-prevention appliances’ did ‘a marked improvement’ occur.238

In 1895, a correspondent noted that dry crushing, then universal in Ohinemuri, was ‘injurious to the health of the men in the battery. The Waihi Company made the use of respirators imperative’, but it was said ‘that the men did not take kindly to them’.239 Prompted by the death of a ‘strong, able-bodied young man’ who had worked at the battery for six years before dying from the dust, a Waihi battery hand asked whether men could not be compelled to wear respirators:

They would have a chance to live a year or two longer. The men in the tank shed, where he worked, are almost invisible for fine dust. We know that men are careless of themselves. Then “the powers that be” should step in and frame rules to minimize the risk as far as possible. It is a species of suicide, takes a little longer than putting a charge of dynamite in your mouth and firing it off, but is just as certain.240

This reluctance of miners and battery hands to adopt safety measures recurred at Waihi, although sometimes the company was blamed. The *Observer* in 1896 claimed it was a ‘scandal’ that ‘nothing’ was done in the battery to prevent ‘men dying from the effects of inhaling Waihi dust’.241

237 *Observer*, 29 August 1896, p. 3.

240 Letter from ‘Pro Bono Publico’, *Thames Star*, 3 July 1895, p. 3.

Ten months later, when recording the death of the eighth known victim, it wrote that fans were ‘abating the dust evil’.\textsuperscript{242} These fans, the first attempt to remove the dust from a Waihi battery, were invented by Henry Hopper Adams\textsuperscript{243} and installed in April that year. This invention, ‘the first step of its kind taken in connection with dry crushing plants’, was ‘highly commended’.\textsuperscript{244} The following year, Aroha Gold Mines\textsuperscript{245} experimented with wet and dry crushing at Waio-

orongomai; as it was found more ore could be treated using the wet process ‘and the health of the men preserved, the exhaustive trials made have resulted in favour of the wet crushing’.\textsuperscript{246} When, based on the technique perfected in South Africa in the early twentieth century, a water spray was added to rock drills, many miners failed to use it, and were fined by the mining inspector, who was determined to enforce this preventive method.\textsuperscript{247} Doctors who wanted better ventilation along with water sprays supported his stance.\textsuperscript{248}

The 1911 Royal Commission on the Mining Industry, whilst agreeing on the deadly nature of the disease, considered it had ‘not assumed serious proportions, as in Transvaal, Cornwall, or Bendigo’, and could be ‘much reduced, if not entirely eradicated’, by suitable measures.\textsuperscript{249} Medical examinations of all miners were required from January 1909, when a section of the Workers’ Compensation Act was put into effect, causing mining to be ‘somewhat disorganized’ at Waio-

rorongomai,\textsuperscript{250} as elsewhere. Employers wanted to dismiss men with the disease, prompting miners at Waihi and Reefton to refuse to be examined; the Waihi union threatened to strike if any man lost his job for refusing the medical check. Under pressure from the New Zealand Federation of Miners, the government agreed to amend the legislation.\textsuperscript{251} At Waio-

rorongomai, miners working in the

Premier\textsuperscript{252} were ‘examined and returned to work as usual’, whereas those working for Waiorongomai Mines Ltd.\textsuperscript{253} ‘being Union Men’, were ‘awaiting instructions from the Union before acting’. Despite the \textit{Te Aroha News’} anticipation of ‘interesting developments’,\textsuperscript{254} the union did not instruct its members to refuse to be examined.

Reminiscing in 1985, McAra explained why battery owners persisted with dry crushing despite the health risk:

Initially they used dry-crushing in order to get fine crushing - they thought if they kept it dry and so it more or less flowed, it didn’t cake together then, they could get finer grinding and get the fine gold out of it. They had to have extremely fine ... grinding to get the fine gold out. If you had fragments too big, well it meant that ... the solutions couldn’t get at the contained gold to dissolve it. So the idea was to crush it, and so in order to facilitate that they would heat the ore up - they’d put it in these kilns and put a layer of wood and a layer of ore and a layer of wood right through for about thirty feet up and set fire to it, and that would dry it out thoroughly and then that would be put into the crushers and crushed and, oh, the dust must have been terrible - the coarse dust - they didn’t recognise at that time how injurious silica was, and of course it was pure silica.... The reason for the dry crushing, and drying the ore and so on, was mainly to get a better recovery, and ... instead of getting 35%, they got 65% as soon as they started that. And then the cyanide process came in in 1894, and that meant that they were dissolving the gold in cyanide solution, so they didn’t need to worry about getting water in it, so they started wet crushing fairly soon after that and it was in operation at Waikino anyhow in 1901.\textsuperscript{255}

McAra also recalled that, when he was supervising mining at Tui in the mid-twentieth century, as men did not always hose down the face after a firing ‘some of them got a bit of dust that way I suppose’, although the amount would have been minor.\textsuperscript{256} This failure to adopt safe mining techniques was not simply a matter of laziness. At Waiuta, on the West

Coast, contractors were reluctant to use water sprays because these lowered their income by slowing the work. Eric Coppard, when mining at Tui in the 1960s and 1970s, noticed

one particular man, an Australian miner, was using the dry dust as a means of compensation. He was eligible for compensation under the Act because of the dusted lungs but he knew that if he could get just a little bit more he would get a better compensation and he was deliberately trying to make his lungs worse, which you wonder at - the mentality of people, but circumstances, I guess, dictated that sort of drastic action.

The 1911 Royal Commission recommended measures to prevent dust and gases being inhaled. It also recommended free medical advice for diseased miners and the provision of ‘adequate relief’ from the Gold-miners’ Relief Fund. The terms under which relief was granted were not generous. In 1914, regulations permitted relief funds to be allocated to a miner or battery hand whose medical certificate proved he was incapacitated, at the rate of 2s 1d per working day, the total sum not to exceed £50. This amount could be given in a lump sum if the Public Trustee was satisfied his incapacity was likely to be permanent and that he intended ‘to invest the amount in a business to enable him or his family to earn a living’. Up to £50 could be paid ‘for the relief of the family’ of those who died from the disease, with up to £20 for funeral expenses. Because the legislation gave assistance only to ‘moral’ and ‘sober’ men, an Observer editorial on the Miners’ Phthisis Act of 1915 was headed ‘Let ’Em Rot! Phthisis, Miners, and Morals’. This Act established a pension of £1 per week, with 12s 6d a week for widows, plus £20 for funeral expenses, at a time when the average weekly wage was approximately £2 10s. McAra noted that ‘between 1915 and 1939, when miners’ and miners’ widows’

pensions were transferred to the Social Security Act, over £1,000,000 was paid out’.263

The number of those who died of miners’ complaint is not known, partly because it was not always recorded on death certificates even if it was the long-term cause of death. Various respiratory problems resulted from miners’ phthisis; bronchitis, for instance, was often caused by it.264 The Registrar General of Births Deaths and Marriages, requested in 1909 to report the number of deaths, could not do so because of inadequate information, the type of mining often being unrecorded. He reported that deaths from phthisis totalled 26 miners and three gold miners in 1899, 23 miners in 1900, 19 miners and two gold miners in 1901, 24 miners and one gold miner in 1902, 18 miners in 1903, 15 in 1904, 17 in 1905, 25 in 1906, 23 in 1907, and 14 miners and one gold miner in 1908, out of an average of 4,350 quartz miners in the latter year.265 Some of those designated ‘miner’ were coal miners, another cause of confusion in attempting to assess the impact on quartz miners.

The number of professional miners who participated in the Te Aroha rush and became part owners of claims was 137, and a further 15 who joined in the rush to Waiorongomai likewise became claimholders.266 Many more full-time miners participated in these rushes and later worked at Waiorongomai and Tui, but as they did not acquire interests their names often are unknown and their careers have not been traced. These professional miners were distinct from those who tried their hand at mining for the first (and, almost invariably, last) time. There were also a considerable number who, despite sometimes describing themselves in official records as miners, were in fact speculators or storekeepers or other ‘camp followers’. Only those who were full-time miners have been included in the total of those who died from miners’ complaint. It should be noted that an accurate total is impossible, in part because not every miner’s death certificate has been traced and in part because, especially before the disease was commonly recognised, often it was not recorded as the cause of death. In some cases, certificates recorded heart failure or stroke, and only by

263 McAra, p. 251.
265 ‘Miners’ Phthisis: Report of Registrar General’, 17 November 1909, Legislative Department, LE 1, 1909/188, ANZ-W.
266 A footnote documenting these figures would be long beyond belief.
checking newspaper obituaries or earlier reports can the fact that they had this disease be discovered. The figures given below are, therefore, under-
estimations.

Of those miners who participated in the Te Aroha rush, 14 died of miners’ complaint.\textsuperscript{267} Of those who mined at Waiorongomai in the 1880s, 23 died of the same disease,\textsuperscript{268} as did two who mined at Tui in the same decade,\textsuperscript{269} three who mined there or at Waiorongomai in the 1890s,\textsuperscript{270} and two amalgamators who worked in the Waiorongomai battery in the late nineteenth century.\textsuperscript{271} Men who mined at Tui, Te Aroha, or Waiorongomai in the twentieth century were still susceptible to the disease. Of those who mined in the first decade of that century, six died from this cause,\textsuperscript{272} as did two who mined in the 1920s,\textsuperscript{273} and four who prospected during the early 1930s.\textsuperscript{274} These totals do not include miners who had become investors. For instance, Henry Brownlee acquired claims at Tui in 1909, but, although a certified mine manager, did not work on them personally, having become a publican in Thames in 1905.\textsuperscript{275} Possibly he took up that less strenuous occupation because of his health, for he was granted a mine manager’s

certificate only seven years before ceasing mining. According to his 1901 evidence about mining at Thames, he had to ‘beat out the gas with sacks, and in doing this they of course inhaled a portion of the gas. He had been in places where even a candle would go out’. He also ‘had experience with rock-drills’. When he died in 1931, aged 65, his occupation was recorded as ‘miner’, although he had not mined for 30 years; his death certificate recorded his having suffered from pneumoconiosis for six years, although his death was caused by heart failure. ‘A patient sufferer at rest’, his death notice stated.

As McAra noted, ‘it usually took many years for the disease to manifest itself and a further lengthy period for it to cause incapacitation, sometimes more than twenty years’. Because rock drills were used in only a couple of Waiorongomai mines, and the battery worked, intermittently, for only a few years, those working on this field did not die as quickly or at such a young age as some at Waihi. For instance, John O’Shea, who participated in the Te Aroha and Waiorongomai rushes, did not die until 1942, when aged 77. His occupation was recorded as ‘goldminer’, and the cause of death a stroke; but by 1937 he was receiving a pension for having miners’ phthisis. In several cases, the length of time men suffered from the disease was unstated. Of this sample, the man who died in the shortest time was Thomas Casey, who mined at Waiorongomai in the 1880s, and then went on to mine elsewhere, particularly at Kuaotunu; when he died

phthisis at least 30 years’, which finally resulted in a six-week attack of pneumonia ‘sapping his vitality and leading to heart failure and death’.298

Clearly having miners’ complaint did not mean an early death. The medical officer in charge of Thames hospital for four and a half years before 1911 stated that ‘chronic lung-disease’ was ‘very prevalent’ there. Those with this condition ‘were old miners, who had lived at Thames for many years’,299 Apart from those noted above, one Te Aroha miner, De Courcy James Young, died in his thirties, five in their forties,300 six in their fifties,301 thirteen in their sixties,302 twelve in their seventies,303 ten in their

years. Roberts had received a miners’ phthisis pension from at least 1932. The sufferer who lasted the longest was Thomas Dunn, who had participated in the Te Aroha rush. When he died in Thames Hospital after an unknown number of years fighting the disease, he was 99 years old.

Mining in the Te Aroha district may have played only a small or even negligible part in causing these lung troubles, for all mined in other districts as well. William McPeake, for instance, participated in the Thames rush of 1867 and mined there for some years. He joined the Ohinemuri rush of 1875, and attended the opening day of the Te Aroha field, but held an interest in only one claim. Returning to Thames, he mined there throughout the following decade, becoming a mine manager at Te Mata in 1889. He may have given up mining because, in 1892, when ‘taking down some loose rock which had previously been shattered by a blast’, he received a ‘severe gash in the fleshy part of his left leg just below the knee’ from a falling piece of stone, and was hospitalized. Alternatively, miners’ complaint may have weakened his stamina. Whatever the reason, he

became a grocer in Thames before dying five years later of phthisis pulmonalis, aged 61.\footnote{Thames Advertiser, 18 February 1897, p. 2; Death Certificate of William McPeake, 13 September 1897, 1897/4033, BDM; Probates, BBAE 1569/2713, ANZ-A.}

In some cases, other occupations may have contributed to, or even caused, the disease. Patrick Moriarty, for instance, died at the age of 54, of pulmonary tuberculosis and exhaustion, when farming at Waihou.\footnote{Death Certificate of Patrick Moriarty, 12 September 1914, 1914/9498, BDM.} According to an obituary, he had ‘been seriously ill for many months, suffering from the deadly “miner’s complaint,” but he was conscious till the last and had a peaceful ending’. After mining at Waiorongomai during the 1880s, with several other local miners he went to work at Broken Hill, but ‘only remained there about six months, many of the band getting “leaded.” It is thought that it was at Broken Hill where the deadly complaint which caused his death was contracted’.\footnote{Te Aroha News, 14 September 1914, p. 2.} The death certificate recorded that he had suffered from miners’ complaint for 33 years, meaning his lungs had first been damaged in 1881.\footnote{Death Certificate of Patrick Moriarty, 12 September 1914, 1914/9498, BDM.}

Thomas Mangan, who was not included in the earlier list of Waiorongomai because his involvement was as an investor,\footnote{Te Aroha Warden’s Court, Register of Licensed Holdings 1881-1887, folio 133, BBAV 11500/9a; Certified Instruments 1883, no. 382, BBAV 11581/4a, ANZ-A.} was a successful tributer at Thames from 1879 to 1881.\footnote{Thames Advertiser, 29 April 1879, p. 3, 15 November 1879, p. 3, 9 August 1880, p. 3; ‘Thames Tittle Tattle’, Observer, 17 September 1881, p. 6.} First appointed a mine manager in 1890, he gained his mine manager’s certificate in the following year.\footnote{Thames Advertiser, 15 April 1890, p. 2, 27 March 1891, p. 2; New Zealand Gazette, 11 February 1891, p. 299.} Shortly afterwards, he accepted an offer to manage Ralph Bros’ coal mine at Huntly, but within four months he had become an amalgamator at the Waihi Company’s plant.\footnote{Thames Star, 1 April 1891, p. 2; Thames Advertiser, 1 August 1891, p. 2.} This appointment was also brief, and he mined at Thames from 1892 to 1894.\footnote{Thames Advertiser, 2 December 1892, p. 3, 7 February 1893, p. 2, 17 July 1893, p. 3, 25 October 1894, p. 3.} After going to the new goldfield at Coolgardie, Western Australia, he returned after ten months to become...
manager of another Thames mine. Mangan was still mining at Thames in 1915, dying three years later aged 60 of pneumoconiosis, which had seriously affected him for the previous three years. It was likely that a combination of Huntly coal dust, Waihi quartz dust, and dust from several gold mines ‘dusted’ his lungs.

If only slightly affected by the disease, some miners kept working and were not entitled to a pension. In 1927, a doctor told Thomas Stewart, who prospected and mined for many years at Te Aroha and elsewhere, that he was not ‘bad enough’ to get one. He continued to prospect at Waiorongomai during the 1930s, dying in 1944 aged 76 after 20 years of gradual physical decline.

MEDICAL SERVICES

Because of illnesses created by mining, accidents in general, periodic epidemics threatening the lives of children, and the perils of childbearing, quite apart from more common ailments, provision of medical services was a priority, but until the twentieth century was inadequate. An outbreak of scarletina in 1881 caused residents to seek medical assistance from Hamilton, and a local correspondent suggested that the county council should arrange for periodic visits by a doctor. This suggestion was ignored because an Auckland doctor, William Harvey, moved there in

June that year for a short period.\textsuperscript{337} Harvey had, briefly, been in charge of the Auckland Industrial School,\textsuperscript{338} with his wife as its matron.\textsuperscript{339} After his departure, there was no local doctor until February 1883, when John Bond, ‘late surgeon to the passenger ship Hurunui’, settled. Being ‘young, active, and a good horseman’ and therefore available ‘at all times and seasons’,\textsuperscript{340} his arrival was greeted with relief, for he would ‘supply a want which has been very much felt in this neighbourhood lately, as in case of sickness we were hitherto obliged to send 40 miles for a doctor’.\textsuperscript{341} He did not stay long, being fondly farewelled in September with hopes for ‘every success in his new charge’ at Auckland Hospital. He had ‘won the admiration of everybody by his cordial good humour and gentlemanly ways’.\textsuperscript{342} In October, two more doctors announced that they would settle in Te Aroha, one of them, named Buckley (who was not listed in the medical practitioners’ register in the \textit{New Zealand Gazette}), replacing Bond.\textsuperscript{343} The other was Arthur Richardson, formerly of Auckland.\textsuperscript{344} Both would be needed, the \textit{Te Aroha News} considered, because of the growing population.\textsuperscript{345} Three months later, it reported that they were struggling to make a living: ‘one medico has had five cases in three months’.\textsuperscript{346}

In August 1884, Buckley left Te Aroha. As Richardson had left at an earlier but unstated date, Charles Alfred Cooper (whose work is described in detail later) was the only resident claiming medical knowledge; a correspondent wrote that ‘in the interests of the inhabitants it is to be hoped that the demand for his services will not exceed his powers to

perform’.\textsuperscript{347} In late 1886, a petition asked the Minister of Lands for a doctor, the petitioners pledging to provide a subsidy of £150.\textsuperscript{348} When the under-secretary visited Te Aroha he was asked to provide a doctor in connection with the baths because the nearest doctors were at Thames and Hamilton; he advised his minister that if residents provided £100 a year for two years, he supported providing one.\textsuperscript{349} Nothing eventuated, and Cooper had no competition until May 1887, when Alfred Wright settled, his consulting rooms being at George Robson’s pharmacy. Wright had ‘high qualifications and great experience’, and intended to stay permanently ‘should sufficient inducement offer’. He hoped Te Aroha would become a sanatorium,\textsuperscript{350} and in July decided to settle. The \textit{Te Aroha News} was pleased, for ‘the absence of a duly qualified doctor has been long felt, especially by many invalids sojourning at Te Aroha to avail of the thermal springs’.\textsuperscript{351} Appointed physician to the domain board later that year, the board published his pamphlet extolling the hot springs and their curative qualities.\textsuperscript{352} By the following year, Wright had moved his consulting room to the Hot Springs Hotel.\textsuperscript{353} In February, in response to complaints that his fees were too high, he declared he never charged more than the minimum rates fixed by the New Zealand Medical Association, and, ‘in consideration of the badness of the times’, often charged much less. Fees for local residents were 7s 6d for an ordinary visit if within a mile of his office and 5s per mile if living further away. Advice at his home cost 5s and night visits were double the normal rate. Visitors were charged from 7s 6d to 10s 6d, depending on the time taken. ‘To poor persons, and those sent by Charitable Aid, or from Auckland, Thames, and other hospitals, to obtain the benefits of the

mineral water’, he provided ‘advice and any medical attendance’ required free of charge.  

Six months later, when Wright was appointed as surgeon at Westport hospital, the Te Aroha News lamented the town’s ‘great loss’, but noted that Wright had obtained a more lucrative post than Te Aroha could offer. After his departure Robson, the chemist, acted as a doctor in the case of a burn victim, and a doctor was brought from Thames to treat two patients. Not till July 1889 did another doctor, Edward Waddington, announce that he would settle in the township. He came with commendations from the Waikato Times that he was very experienced and had ‘the kindest and most sympathetic of dispositions’. Waddington did not settle then, although he did visit for three days in November, when he was consulted by ‘quite a number of patients’. When he settled a year later, the same newspaper forecasted that he was ‘sure to become as popular’ in Te Aroha as he had been in Waikato, where he still enjoyed ‘the confidence of a very large number of friends’. He intended to turn Waverley House, a large boardinghouse, into ‘a well appointed hospital, on a small scale’. The newspaper repeated how fortunate residents were ‘in having so skilful and popular a man’:

> Already we have heard of some important cures having been effected by him in very trying and obstinate cases. The curative properties of the different waters, used under the direction of a physician, and in conjunction with other means, must under such circumstances produce results that could not be looked for under the ordinary haphazard use of the baths.

Waddington denied he would provide a hospital, only planning to set aside rooms for ‘massage, electro-therapeutics, and hydro-therapeutics’. As copies of the local newspaper do not exist between mid-1890 and 1895, it is not known when he departed, but it was before the latter year.

Other doctors visited, most not staying. Frederick Samuel Daldy, of Auckland, announced in August 1889 that he was available for consultation at the Palace Hotel. In October 1895, Frederick Wright Simpson arrived from Auckland; a correspondent considered there was ‘undoubtedly an opening here for a doctor’, and hoped he would ‘be encouraged to stay’. Another correspondent agreed that want of a doctor had been ‘a great drawback for years past’. As Simpson was unsuccessful in asking the town board for a guarantee of his income, he left within weeks, not having received ‘sufficient encouragement to establish a permanent practice’. The following month, a doctor had to be brought in from outside to treat a patient. As an illustration of the problems created by the lack of professional care, the following experience was published:

A settler at Shaftesbury, whose wife is lying in a dangerous condition, sadly in need of the best medical attendance, on Monday drove hurriedly into Te Aroha and though the local medico [Charles Cooper?] was not to be found, there was comfort in the fact that a visiting doctor from the Waikato was already on his way by train to Te Aroha, and accordingly down to the station the trap was driven, that no time might be lost in trans-shipping the doctor and hiring him out. But the doctor, hearing that the house was six or seven miles off, found that he would be unable to spare the time taken in going so far from most of his patients so the visit to the railway station was in vain. With the telegraph office about to close, an urgent wire was then sent to Dr Forbes, of Paeroa, but the wire did not reach him soon enough to permit of his catching the evening train. The distressed husband could but ride home to return again next morning to meet the early train, by which Dr Forbes had hurried up and the Shaftesbury man had at last the satisfaction of having secured a doctor, although only after so much previous delay and vexation. It is apparent that no time should be lost in securing a resident doctor for Te Aroha.

To obtain a ‘duly qualified medical man’ for the districts, a meeting held in May 1897 formed a medical association. A committee of 23 with power to add to their number was formed to draw up rules and ascertain which doctors might apply. Subscriptions were set at 30s a year for heads of families, 10s for single people, and a fee of 1s 6d per visit to cover the cost of medicine. Circulars invited residents to join, and there was ‘some talk’ of starting a branch of the Oddfellows’ Friendly Society, which ‘would strengthen the hands’ of the association.370 Its secretary attended a meeting of the town board to seek its ‘aid and sympathy’. One board member, Thomas Gavin, said that he knew ‘many invalids’ who would have stayed longer ‘had there been a doctor available for consultation’, and the board unanimously agreed ‘to render every assistance’.371 In July, it asked Alfred Philip Coker372 to be ‘professional advisor of its members’.373 He declined, but in the following month two other doctors considered taking the post, one, Gilbert Smith, being appointed resident doctor in September. To ensure that he received £100 in fees in his first year, the association applied to both government and domain board for a subsidy of £50 per year.374 The government obliged, Smith set up consulting rooms in the centre of town, and in May the following year announced that he would provide nursing at his house.375 However, he did not remain long either, and once again doctors had to be brought in. In January 1900, a Paeroa doctor advertised that he would ‘immediately attend any Patient’s House in Te Aroha on receipt of message or telegram’.376 In July, the domain board, ‘having received an assurance’ from William Cairns377 that he would settle permanently, agreed to give him the government’s annual subsidy and was trying to get it increased.378 Not until the government took control of the domain in 1903

and appointed a medical officer to supervise the sanatorium was the need for a doctor finally met.379

CHARLES ALFRED COOPER

Charles Alfred Cooper, born in 1844, was the second son of a York wine merchant.380 In 1860, he passed the preliminary examination at Apothecaries’ Hall in London, which required a knowledge of Horace and Cicero in the original Latin, the New Testament and the Iliad in Greek, algebra ‘including Simple Equations’, arithmetic, and Euclid, but nothing directly relating to medicine.381 Subsequently, on an unrecorded date the Royal College of Surgeons of England certified that he had passed ‘two Winter Courses of Anatomical and Physiological Studies with Dissections in the Medical School of St Bartholomew’s Hospital in London’.382 It is not known whether he practiced any form of medicine in England, but the Franco-Prussian War of 1870-1871 provided an opportunity to obtain medical (and surgical?) experience. In August 1870 he obtained the equivalent of an English passport to enable him to travel to Europe, where he was to help sick and wounded French soldiers on behalf of the British ‘National Central Committee for Aid to the Sick and Wounded in War’.383 In the following February, the Société de Secours aux Blesses Militaires [Society to Aid Wounded Soldiers] of Paris certified that Cooper, who had

been attached to its ambulance service, had fulfilled his duties ‘to the satisfaction of all’.\textsuperscript{384}

In New Zealand electoral rolls he described himself as a ‘medical practitioner’,\textsuperscript{385} but his name was never listed in the \textit{New Zealand Gazette}’s register of these. After arriving in Auckland in 1877, he was appointed as dispenser and clerk in the Provincial District Hospital in Auckland. In his application Cooper stated that he was ‘not a diplomatized man, but he is possessing documents shewing that he has received a medical education at St Bartholomew’s Hospital, London, and that he served in the field, during the late Franco-Prussian war’.\textsuperscript{386} Until resigning (when he was still officially a dispenser) in December 1882, he was called the hospital’s house surgeon.\textsuperscript{387} There was never any hint that he did anything but a good job in this role. After leaving Auckland he continued to describe himself, and to be described by others, as a surgeon,\textsuperscript{388} but he did not act as one after leaving Auckland apart from repairing broken limbs.

Having left Auckland in early 1883, in June that year he treated an accident victim in Paeroa.\textsuperscript{389} Three months later the \textit{Te Aroha News} understood that he intended ‘settling down in this district, for the purpose of practicing his profession’.\textsuperscript{390} His day-to-day ministrations were not recorded, but, presumably because of his hospital experience, he was regularly called upon to treat those suffering from broken bones and other

consequences of accidents not only at Te Aroha and its environs but also at Paeroa, Karangahake, Owharoa, Waitekauri, Waihi, Waitoa and Morrinsville. On one occasion he removed tubes left inside a patient by an Auckland Hospital doctor, leading to a complete cure. His rushed travels to treat injured people some distance from Te Aroha led to his being injured by being thrown from his horse. Over the years several testimonials were published to his kindness and competence. On occasions doctors came to Te Aroha to consult with him about difficult cases.

Cooper would have endeared himself to local miners in 1884 by contributing £5 1s to the Te Aroha Miners’ Accident Relief Fund. In September 1886, when a public meeting discussed a proposal that the government subsidize a doctor to settle in Te Aroha, ‘this motion appeared to be altogether contrary to the views of the large majority of those present, mainly owing to the fact that the local medico, Dr Cooper, would, they thought, probably suffer if the request was granted’. The same July 1887 issue of the Te Aroha News that informed its readers that ‘the absence of a duly qualified doctor’ was about to be rectified by Alfred Wright settling in the township also reported that the friends and supporters of Dr Charles Alfred Cooper were about to form a medical club with him to serve as their

The Aroha and Ohinemuri Medical Club was duly formed, and in the following month a Paeroa meeting established a club affiliated with it. In February 1889 the Ohinemuri County Council appointed him as its Health Officer for 12 months, the term he had requested, for the modest salary of £12 a year. In the following May he was the victim of council cost cutting, being, as a correspondent put it, ‘invested with the ancient order of the sack’.

In his last years he dealt with fewer patients, usually after accidents; there was mention of his treating people only once in both 1901 and 1902. The last person he treated, just before his death in 1903, had accidentally shot himself but not seriously. An obituary stated he had ‘practiced but little in Te Aroha, and lived a somewhat retired life’.

On occasions his competence was challenged. Alfred Henry Whitehouse, a shoemaker, had chaired the meeting forming the medical club and was its secretary, but in 1888, when his wife died after using Cooper’s services, Wright told the inquest that if she had been given proper medical treatment she would not have died at that time. However, as Cooper was at Paeroa at the time of her sudden death, he could not be blamed. Ten years later, Dr Gilbert Smith declared that medicine for a man who had died on his way to Hamilton from Te Aroha ‘was prescribed by Mr Cooper, an unqualified and unregistered man’, although he added that it would not have harmed the deceased. Edwin Hadfield his being crippled

after his leg was smashed in a mine accident by Cooper's mismanagement.409

Controversially, in 1897 Cooper had been charged with administering drugs to procure an abortion, but the case was not substantiated.410 According to the Paeroa newspaper, ‘no one who knew Dr Cooper would for a moment believe him capable of such an act, and we are very glad that the charge fell through’.411

Perhaps one reason why Cooper left Auckland and was occasionally criticized later on was because he had a drink problem. In 1887 he was charged with owing a bankrupt £2 5s for unpaid drinks.412 Seventeen months later he was charged with excessive drinking. When asked by the magistrate whether he wished to comment on the application to impose a prohibition order, Cooper ‘said he had no remarks to make, and wished the order should be made’.413 In 1894, one ‘Buz-fuz’ wrote a letter, now lost, to the Te Aroha News about his drinking, provoking a response from ‘Fair Play’:

The doctor in question may not be a Good Templar [abstainer], but that he is an able man no one will dispute, and even “Buz-fuz” admits that, and so long as Dr Cooper attends to his business and there is no charge against him, it is unfair that he should be molested. It is well known that there is not sufficient here to keep a duly qualified man in our midst. Let us keep what we have in case by agitation we lose both – remember the old adage “half a loaf is better than no bread.”414

In 1879 Cooper married Mary Jane Vaughan, who had been born in New Zealand in 1857.415 They would have two boys and a girl between 1880

and 1884. Mary Jane was a notable member of Auckland society, in 1881 being recorded as having attended a social event in the Choral Hall with ‘her pretty little boy’, her eldest son Vaughan. Three months later, the Observer headlined her as ‘A Belle of the Present – Mrs C.A. Cooper nee Mary Vaughan’ in its list of the belles of Auckland:

Although getting towards the last of the belles, certainly not the least, as far as looks and cleverness are concerned, comes pretty Mary Vaughan, who in 1877 took the part of Fredegonda with such success in “Chilperic,” also Vivien in “King Arthur,” charming everyone by her acting and singing. She was Miss Christian’s favourite pupil. How is it we never have the pleasure of hearing her sing now? Are her matrimonial cares too great? Mary was a great favourite of Sir George Arney’s when he resided here, and he hardly ever passed through Parnell without calling to see (as he called her) “pretty little Mary.” She is also one of Mr [William] Swainson’s favourites, and when she pays him a visit they generally have a musical evening. Although she has now two children to take up her time, we hope to hear her sweet and powerful voice again in public at no very distant date.

The musically-minded were to be disappointed, for she was not mentioned in the Auckland press again until April 1885, when after having lived for about 18 months at Te Aroha she returned to visit her parents, William and Eliza; while staying with them, her father committed suicide. If she did return to Te Aroha after her father’s death she soon returned (with her children) to Parnell to live with her mother until the latter’s death there in 1896; Eliza’s death notice recorded that she was

'the beloved mother of Mrs Cooper, of this city'. There was no divorce, but Mary Jane continued to live in her mother’s house in Parnell for some years before living in another part of the suburb until her death in 1946. One way or another, she learnt of her husband’s death. The First World War brought tragedy: the deaths of her elder son and her son-in-law.

Having lost his wife and children, Cooper did not need a large house, and therefore acquired a residence site for a small cottage in July 1896. When he died, an obituary recorded that he was believed to have a ‘large grown up family’, but their whereabouts was unknown. His death occurred ‘suddenly’, in 1903, when he was aged only 57 and living ‘alone in a two-roomed cottage’. A friend discovered his body ‘jammed between the bed and the wall’ after, it was surmised, a fall, leading to death caused by suffocation. At his funeral, ‘a large number’ followed his coffin to the cemetery, his coffin being ‘covered with floral emblems, testifying to the esteem in which the doctor was held by the community and by whom he will be sadly missed’. Subsequently, at a ‘citizens’ meeting’ to discuss erecting a memorial over his grave, its chairman ‘spoke of the doctor’s habitual

kindness to the people of the district, and other speakers made eulogistic references to his character'. A committee of leading residents was formed to collect subscriptions, which must have raised a considerable sum, for a lavish grave and headstone was erected.432

A HOSPITAL NEEDED

In July 1883, the *Te Aroha News* complained that, despite the ‘certainty’ of the district becoming a large mining and farming centre, it had no provisions for the sick, who were generally taken to Thames. As it was ‘out of all reason that a journey of such length should be needful’, it was time to establish ‘one of the most necessary as well as noble institutions, a properly-equipped hospital’. Although the district was ‘exceptionally healthy, and anything like epidemics’ were ‘unknown’, this immunity would not continue, and mining starting at Waiorongomai meant a larger population and ‘more accidents and illness’. Already some people had ‘no means of procuring proper care and attendance in the event of their being prostrated by sickness’, and this number would be ‘very largely added to’ when the mines were fully developed. It expected the government ‘would at least lend some substantial assistance towards the erection of a suitable building and its furnishing’, and that the council would then subsidise it, the government giving

£ for £ on all subscriptions gathered from all sources. Not only is this afforded on direct voluntary contributions, but the net results of entertainments given in aid, of whatever kind, of charitable subscriptions gathered at churches or other, and we are sure that this district would readily assist in such a good cause. A local committee, elected by subscribers, would as in other places, manage the internal arrangements, and these are elected annually.

Miners who subscribed would ‘insure themselves against a bad day’, for they could ‘demand admission in case of serious illness, as a right and not a charity’. As ‘mishaps of greater or less consequence’ were frequent in

432 Press cutting from unknown newspaper, n.d.; photograph of grave in Te Aroha cemetery, Roger McGirr Papers, in private possession.
all mining districts, establishing a hospital was ‘a paramount necessity’, and it hoped one would be established soon.433

The editor was far too sanguine. Eight months later, in reporting that a Waorongomai boy whose leg had been broken by a horse had been sent to the Thames hospital, a correspondent wrote that ‘a considerable number of patients have been sent to that institution within the last few months’. He regretted that no steps had been taken to establish a local hospital, but understood that land had been ‘set apart for hospital purposes’, and hoped that ‘before long’ a ‘suitable building’ would be erected.434 Nothing of substance happened until 1906, when there was ‘an agitation’ for the establishment of ‘an emergency ward for urgent cases’.435 After a man was thrown from his horse and ‘dragged some distance’, the local doctor treated the injuries to his head and thigh before he was sent to Thames. This accident was cited as ‘an instance for the establishment of an emergency ward’ where accident victims ‘could be properly looked after, pending their removal to the hospitals at Thames or Hamilton’.436 Late that year, parliament voted money for an emergency ward.437 As this led to nothing, in April 1909 a prominent resident, Captain Knyaston Forster Walter Lyons-Montgomery,438 explained the attempts made to obtain a hospital:

Some years ago a certain sum was placed on the Parliamentary Estimates for the purpose of erecting a cottage hospital at Te Aroha. £300 was used by the Government in acquiring a property, which (after purchase), on inspection, was condemned as unfit for the purpose for which it had been purchased, and although letters have appeared in our local press asking the Government to use the balance of the grant, as voted by Parliament, nothing has been done up to date. The modus operandi at present here is: The patient (whether suffering from an infectious disease or otherwise) has to be first removed by cart or cab to our railway station, then by train to Hamilton station, then again by cart or cab to Hamilton hospital. If this is not a disgrace to any Government, tell me what is. Why keep this amount locked up when it has been on the Estimates for years for the purpose of

433 Editorial, Te Aroha News, 14 July 1883, p. 2.

437 Thames Star, 3 November 1906, p. 4.
erecting a cottage hospital. Whether anyone suffering has died on account of the long journey from here (Te Aroha) to Hamilton I cannot say at the moment, but I would never be surprised to hear that it had been the cause of many patients not recovering. 439

In May a deputation from the borough council asked the Minister in Charge of Tourist Resorts to provide this hospital. He was reminded that not only had this been promised but that provision to meet the cost had been on the Estimates for the past two years. ‘What the residents wanted was something in the nature of an emergency ward, under the control of the Department’s medical officer’. The minister responded that, although money might be granted for the building, ‘it was quite out of the question to expect that the Department would maintain a hospital’. As well, he was ‘afraid’ that the amount allotted ‘would not go far towards the erection of a suitable building’. 440 Not until 1912 was an ‘up-to-date’ hospital established in a private house, run by a former Auckland hospital nurse. 441

OTHER WAYS OF PROVIDING ASSISTANCE

As Te Aroha lacked a dentist, visiting ones offered treatment in hotel rooms. For example, in February 1885 a ‘Surgeon Dentist, from Auckland’, advertised that he could be consulted during that week at a hotel. ‘ARTIFICIAL TEETH supplied on the spot. Painless extraction of Teeth. Teeth stopping in all its branches, etc’. 442 Two dentists visited at the same time in 1889, one advertising that he would ‘(if inducement offers) visit Te Aroha at regular intervals’. 443 Several dentists visited in later years. 444

To some extent, local women met women’s medical needs. In 1888, a resident of Waihou East, ‘MRS BUTLER, LADIES’ NURSE, (Late of Wellington and Auckland)’, announced that she was ‘open to receive

444 For example, Te Aroha News, 17 April 1895, p. 2, 4 May 1895, p. 2, 15 May 1895, p. 2, 21 April 1898, p. 2.
ENGAGEMENTS, and CONFINEMENTS, if required’. The following year, another professional nurse advertised her wide range of services: ‘Medical, Mental, Surgical, Midwifery’. These women were not mentioned in recollections of the early township, and may have only worked for a short time. Recollections agree that for 31 years the principal nurse was Ann Devey, wife of George.

Without a hospital and without permanent doctors, other ways had to be found to cope with illness or accident. In 1898, the St John Ambulance Association called a meeting to form a first aid class, and over 20 ‘of our more intelligent ladies’ and six young men enrolled. After attending lectures, eight of the women passed their examination, which according to the secretary of the Auckland centre of the association was a ‘much higher’ percentage of successful candidates than was ‘usual in country classes’. Although several more women reportedly wanted to learn first aid, later courses were not mentioned, although these may well have continued.

In serious cases, people had to go elsewhere for treatment. In 1889, for instance, a Waiorongomai miner, Robert Guy, was summoned to Auckland where his wife, who was seriously ill, had gone for medical help. On this occasion, she recovered, but two years later she gave birth in Auckland to her first child, a daughter who died three days later. Remaining at her mother’s house there, she died aged 34 because of ‘persistent oozing of blood from fibroid of uterus one month after child birth’, indicating that having access to medical attention was no guarantee of survival.

The hot springs were seen as curing many ailments, cheaply.\textsuperscript{455} More expensive treatment was possible from some alleged medical experts who were employed to treat invalids, such as ‘Professor’ Cadman and his ‘Magneto-Electric Continuous double Current Girdles’ and similar inventions.\textsuperscript{456} Upon application, the domain board permitted impoverished residents and visitors free use of the baths for a month or longer.\textsuperscript{457} Others, to ensure that they could afford medical treatment, paid regular contributions to the sick and funeral funds of a friendly society.\textsuperscript{458}

**CHEMISTS ACTING AS DOCTORS**

During the first rush, chemists filled the role of doctors by sewing up wounds or providing medicine and medical advice, although their competence was questioned.\textsuperscript{459} In later years, George Robson, the local chemist, continued to be the professional of first resort, especially for the treatment of accidents. When a boy was badly burnt after playing near the fire in his Waiorongomai home in 1888, ‘there being no medical man within reach’, Robson was sent for. He ‘dressed the wound, and was most attentive to the poor little sufferer up to the time of his decease, doing everything he could to allay the pain’.\textsuperscript{460} Robson had been a chemist at Hamilton from the late 1870s until moving to Te Aroha in 1882.\textsuperscript{461} As the sole chemist from 1883 to 1907,\textsuperscript{462} he had a vital role in the health of the community. Occasionally he was mentioned as treating the injured. When Michael Quigley fell 15 feet in the Colonist mine in 1883, Robson dressed his large

scalp wound and inserted two stitches.\textsuperscript{463} Eleven years later, he treated a woman who broke a small bone in her arm.\textsuperscript{464} In the same year, he treated people poisoned by eating wild honey.\textsuperscript{465} Six years later, he had to deal with a crushed finger.\textsuperscript{466} His skills included extracting teeth, and he also sold horse and cattle medicines.\textsuperscript{467} ‘Piako Gran’ recalled that he had a room where he extracted teeth, bandaged cuts, treated stone bruises, or made slings for sprained arms. The local constable ‘had a “blind eye” when it came to hours of trading in the chemist shop’.\textsuperscript{468} That he kept up with all the latest medical inventions was indicated by his 1905 announcement that he had electro-magnetic belts for sale.\textsuperscript{469}

That chemists’ skills were inadequate to deal with all accidents was revealed in January 1883 when Paerutu, son of a Ngati Rahiri rangatira, Keepa Te Wharau,\textsuperscript{470} fell from a peach tree and broke both arms, one a compound fracture. Keepa stated that ‘almost immediately after the accident’ his son ‘was treated by some one in the district, who administered medicine until mortification set in, when he advised the father to take the child to the hospital’. The doctors there realized ‘the case was too far gone, and the patient too weak to submit to amputation’, and there was no hope ‘for the poor little fellow’s recovery’. A Thames newspaper considered that ‘some steps should be taken by the authorities to ascertain the truth or otherwise of the statements made by Keepa as to the treatment of the boy’.\textsuperscript{471} After his death, this newspaper received a telegram from Te Aroha stating that ‘a local chemist endeavoured to set one of the arms’, and ‘assured his parents that it would be “Alright in a few days” ‘.\textsuperscript{472} Whether Robson was the chemist referred to is not certain, for at the time an

Auckland chemist, Matthew McGarvey Eccles, had a branch pharmacy there until selling it to Robson in June.

**AMATEUR DOCTORS AND NURSES**

In late 1886, the domain board considered appointing ‘Professor’ J. C. Cadman as an unpaid ‘hydropathist’, there being no resident doctor at Te Aroha then. Shortly afterwards, a miner living at Quartzville, Charles Peters, placed a ‘deserving word of praise’ in the local newspaper lauding his skills in ‘electopathy’:

> For 19 years I have been a great sufferer from lumbago and rheumatism, the pain being so severe that I was unable sometimes to bend my back and walk. I was under the Professor’s treatment for one week and he not only relieved me of all pain but I have ever since been able to touch the ground with my hands without bending my knees and not feel the slightest pain or inconvenience thereby. Prof. Cadman is deserving of patronage.

But by the time this was published Cadman had resigned his position because of controversy over his appointment. On occasions, in the absence of a doctor residents had to rely on amateur nurses; for instance, two housewives nursed Eliza Whitehouse during her final illness. In other cases, residents took what they considered to be appropriate action.

475 George Wilson to Under-Secretary, Lands and Survey Department, 6 October 1886, Tourist Department, TO 1 1891/198, ANZ-W.

479 *Te Aroha News*, 20 June 1888, p. 2.
1889, a Waiorongomai correspondent reported a ‘distressing accident’, the 18-month-old son of Patrick Moriarty\(^{480}\) drinking kerosene:

The mother’s attention was attracted to the little chap by its violent spitting and coughing, and she saw at once what had happened. The child got rapidly worse and Mr Moriarty hastened to Te Aroha for medical assistance, but none was available. In the meantime emetics were freely administered and with good results, and I’m glad to say the little one appears to be now out of danger.\(^{481}\)

**SELF-MEDICATION**

Some people relied on self-medication. A drunken bushman arrested in 1889 was carrying a bottle of painkiller.\(^{482}\) Bottle collectors who have searched the sites of whare and settlements on the hillside at Waiorongomai have discovered the most common bottles were of cough medicine with a high alcohol content.\(^{483}\) William Tregoweth,\(^{484}\) who invested in one claim during the Te Aroha rush,\(^{485}\) was in 1885 tributing at Karangahake, when his partner complained that as Tregoweth could only do light work he was ‘no good as a mate, and could not work, and had to put hot bricks on his feet every night to keep himself alive’.\(^{486}\) Tregoweth continued to mine, more actively, until he died in 1908, aged 60, of fatty degeneration of the heart leading to heart failure.\(^{487}\) The coroner was told he had complained ‘several times lately about feeling bad inside’ and had

considered the cause to be indigestion and colic, for which he took a ‘lot of pills and other medicines to cure himself’.488

How many people resorted to such ‘remedies’ cannot be determined, nor can they be identified, apart from the wife of Henry Brownlee, for part of his life a miner.489 In 1902, her testimonial was included in an advertisement for Doan’s Ointment, which, she averred, had cured her son of scurvy.490 Patent medicines were available for all the ills known to mankind, including those of a very personal nature. For instance, in 1884 newspaper readers were informed ‘That Husband of Mine is three times the man he was before he began using “Wells’ Health Restorer”’. Three months later, those who had missed the point were given the following message: ‘DECLINE OF MAN - Nervous Weakness, Dyspepsia, Impotence, Sexual Debility, cured by “Wells’ Health Renower”’.491 For women, ‘Towle’s Pennyroyal and Steel Pills for Females quickly correct all Irregularities, and relieves the distressing symptoms so prevalent with the sex’,492 which may have been a disguised advertisement for an abortifacient. According to the Observer, medicines to induce abortion were available in nearly every chemist shop in Auckland and other towns, sometimes being displayed in the windows.493 The following advertisement, which appeared in both the Te Aroha and Auckland press, may have referred to birth control rather than abortion: ‘THE WIFE’S WELFARE - Treatise posted free. It will teach you more than all the years you’ve lived. Every woman should read it. Write Prof. Hermann, French Specialist, 40 Collins-place, Melbourne’.494 Louis L. Smith of Melbourne advertised his mail-order services to ‘patients suffering from nervous affections’ who were ‘afraid from sheer bashfulness and modesty to PERSONALLY consult a medical man’ about ‘their habits of life, and the nature of the disease’. A letter detailing the symptoms accompanied by a fee of £1 1s would result in medicine being sent ‘in such a form as to

defy detection. He implied that he could cure not only venereal diseases but also the ravages produced by masturbation, and possibly also impotence.495

MENTAL HEALTH

Examples of mental breakdown from various causes have been recorded elsewhere: disappointments in love resulted in both Laura Devey and John Squirrell’s daughter being sent to the asylum.496 Not only women who had breakdowns because of their love life, for in 1890 a Te Aroha contractor, a single man aged 38, was committed for ‘Delusions of persecution’ lasting one week caused by ‘Disappointed affections’. Five months later he had recovered and was discharged.497

Poor physical health could affect the mind. For instance, a 63-year-old schoolmaster was committed after an attack of ‘delusional insanity’ caused by ill health had lasted for three months. Being in ‘poor health and condition’, implying a poor diet, although he was married, he died four months later.498 In the asylum he was classified as suffering from religious mania.499

Miners could suffer from mental illness, especially those obsessed prospectors and miners known colloquially as ‘hatters’. Alexander McLeod was aged 49 in late 1888 when he successfully applied on behalf of himself and two partners for the Kiwi, four men’s ground at Tui, which he would work with the adjacent Morgan’s Claim.500 A visitor noted, in October, that he was ‘chiefly’ working the latter.

Very good finds have been made from this claim, but mention of this would have escaped me but for the alleged eccentricity of the above named Mac. It appears he occupies part of his daytime in cutting tracks through the bush, and indeed there are several evidences of his self-imposed labour in this way; where the bush

has been thick, several chains of good clearings have been formed.\footnote{Mines in the Te Aroha District, \textit{Auckland Weekly News}, 27 October 1888, p. 37.}

In early 1889, when successfully applying for the Mararoa, 12 acres at Waiorongomai, he promised to invest £500 in it.\footnote{\textit{Te Aroha News}, 23 February 1889, p. 7, 23 March 1889, p. 2.} In May he told the warden that he was ‘camped close to the boundary of’ the adjoining Lord Nelson, where his ‘mate’ was living in a whare.\footnote{Magistrate’s Court, \textit{Te Aroha News}, 29 May 1889, p. 2.}

McLeod was a single man, and his only relatives, two brothers, farmed near Ashburton.\footnote{Avondale Asylum, Register of Admissions 1885-1896, no. 1600, YCAA 1021/2; Record Book of Investigation into Relatives’ Ability to Pay Maintenance 1890-1899, folio 14, YCAA 1044/1, ANZ-A.} Perhaps his loneliness drove him to drink, for in August 1889 he was charged in Thames, where he was now living, with being drunk in the street. A witness described him ‘making a very peculiar noise, like that of a man in the horrors’, meaning delirium tremens, ‘and was disturbing the neighbours’, who wanted him arrested so they could get some sleep. When the constable arrived, McLeod was in his house ‘making the same kind of noise’, being ‘blind drunk’; he threatened to ‘make it hot’ for the constable, who described him as being ‘in a filthy state’. In court, McLeod (alias John McLeod) ‘admitted having had a few glasses, but denied that he was drunk, and said that if he had been left alone he would have been all right’. The magistrate agreed, dismissing the case,\footnote{Thames Magistrate’s Court, Criminal Record Book 1887-1889, 190/1889, BACL 13736/1a, ANZ-A; Police Court, \textit{Thames Star}, 8 August 1889, p. 2.} but in December McLeod was arrested as being of unsound mind and committed. Being ‘under a delusion that he had a mission to destroy the devil’ he was seen as a danger to others or himself.\footnote{\textit{Thames Star}, 17 December 1889, p. 2.} At the asylum he was diagnosed as having suffering from religious mania for three weeks. His health was ‘impaired’ and his condition ‘weak’.\footnote{Avondale Asylum, Register of Admissions 1885-1896, no. 1600, YCAA 1021/2, ANZ-A.}

A Thames doctor explained why he was committed:

He is suffering from religious mania shouting and singing all night and saying that it is not he who shouts but God in him and that the words could not be understood by any one else, that he is
awaiting God’s command to slaughter the Devil and all his followers, that he says he always sleeps soundly at night when God has finished his singing that he told the constable he was the devil and threatened to slaughter him and that he keeps up a disturbance all night.

An asylum doctor quoted him saying ‘he hears Jesus speaking to him, thinks he is at present imprisoned as a martyr and will eventually be brought before Kings for examination that he sings loudly and claps his hands without ceasing towards night becoming very excited’. On 22 December,

Tells me that he was sent here for speaking about his Saviour – that he found his Saviour nine years ago – He was not sent to the Asylum than as he was not perfect – He is now perfect and sings hymns at night in obedience to God – That others are only disturbed by these hymns because they are wrong and he is right – Continues quiet and diligent.\textsuperscript{508}

He escaped, briefly, five months later, to be discharged ‘relieved’ on 3 June 1890.\textsuperscript{509} Although never committed again, he may have been the Alexander McLeod who pleaded guilty in 1908 to being ‘in a helpless state of drunkenness’ in a Thames street.\textsuperscript{510}

Donald McLeod, not a brother of Alexander despite being a partner in the latter’s Kiwi claim,\textsuperscript{511} was a Waiorongomai miner who had acquired a farm at Gordon.\textsuperscript{512} He went to Australia in the early 1890s and became blind as a result of an injury. He then returned to live with his father (his mother appears to have died) on the latter’s Gordon farm, unhappily, as a sympathetic correspondent described:

\textsuperscript{512} See Tauranga Electoral Roll, 1887, p. 17; Waikato Times, 7 September 1886, p. 2; Te Aroha News, 28 August 1889, p. 2.
He has frequently to be left alone from early morning until late at night, and the wretchedness of his life can well be imagined. Once or twice he has even been left without company all night. His father has made repeated efforts to get him admitted into some of the public institutions for the feeble in the colony, and also into the Blind Institute in Parnell, and has expressed his willingness to support him to the best of his ability, but, for some reason or other, without avail.... If only the young man could be taught to read and write in the blind language, and be instructed in some simple trade, which would occupy his hands and mind, it would be a wonderful relief from the dreadful monotony of his life. Fancy him setting for many hours at a time without a soul to speak to, in an isolated cottage miles from any other human habitation, with nothing to relieve his mind from the contemplation of his blighted life!513

After the Waikato Charitable Aid Board arranged his admission to the Blind Institute, he was expelled ‘for insubordination’ after having refused to learn a trade. Accused of assaulting a staff member, McLeod claimed to have been struck in the face by this man and spoke of other mistreatment.514 He was placed in the ‘refuge’ in Hamilton, but in 1894 his father could not afford to contribute to his upkeep.515 In November 1896, when aged 29, after two years of suffering from dementia caused, it was believed, by heredity, he was committed to the asylum.516 There a doctor quoted him as saying that ‘there are murderers about who are not to be trusted & that they will injure him. He talks about events that happened to him at Coromandel & other places which he has never visited’. He was diagnosed as suicidal and dangerous. His father, John, said that his son had recently ‘become unmanageable’.

He has attempted to injure his brother & other persons & is very destructive in his home breaking furniture etc. That a Bill-hook was found hidden under his bed with which he stated his intention of injuring a neighbour.... He has frequently threatened to hurt & kill a man visiting at his house. Has been frequently violent requiring almost constant watching. A habit too of going out & keeping away all night.

514 *Auckland Weekly News*, 9 September 1893, p. 23.
516 Avondale Asylum, Register of Admissions 1896-1901, no. 2174, YCAA 1021/3, ANZ-A.
His mother had become ‘insane after bearing a large family. No history of drink either in patient or family’. His brother stated that ‘he had a good memory & strong will & was of a dour disposition. Had been gold mining for 10 years. Led a lonely life was eccentric all his life but had no delusions till lately. History of Syphilis three years ago’. (As he was unmarried, someone had consoled his loneliness.) ‘Head injured 18 years ago’. As he was nearly blind in his right eye, and completely blind in the left, he was unable to work. The doctor noted that, although the syphilis had affected him, he was well conducted, and denied he was violent; he had hit his brother only after being hit. The following April, a doctor noted: ‘Hard to say if this patient is certifiable’, but in subsequent years he was described as stupid, confused, violent, and dangerous. In 1907, he was ‘Solitary and demented. Stands listlessly about airing-court and has no interest in anything. Kicks any one who comes near him’. McLeod never left the asylum, dying there in 1932, aged 65.

‘Melancholia’ led to a 57-year-old unmarried miner being admitted to the Thames hospital in July 1886. As his condition had not improved, two days later he was sent to the asylum. There this diagnosis was confirmed, though the cause could not be discovered. As a knife had been discovered under his bed in the hospital, it was assumed he was probably suicidal. ‘When admitted here was silent and apathetic – can give no account of himself & is very long in answering any questions. Very dejected in appearance, bowels obstinate & tongue furred’. Three months later, he was ‘much improved in nutrition’, but some of his facial muscles were paralyzed, probably because of an old wound; ‘in conversation he is now quite rational’. Accordingly, one month later he was discharged as recovered. In February 1888, when he was a shipbuilder at Parnell, he was recommitted, for ‘Senile Melancholia’. Then ‘in weak health anaemic & ill-

nourished’, he was discharged as recovered in April 1889, and never committed again.

Thomas Kenny mined at Waiorongomai in the early 1880s, and was still a miner when he married a widow with three daughters in 1898, when he was aged 37. Eight months later they had a daughter. In 1905, when living in Auckland, and less than three months after the birth of their fourth child, he was arrested for firing two shots at his wife. ‘When arrested Kenny stated that he merely fired the shots with the object of frightening his wife, and not with the intention of shooting her. He is said to have been in the habit of carrying a revolver for some time past’. Mary Kenny gave evidence that her husband came home at ‘about seven o’clock’.

She could not say that he was sober. He had some words with the witness when he came in, using some bad language in speaking about witness’ daughter and nephew. He said he was going to put an end to things, and went into the scullery, returning with a revolver…. Kenny told witness to “get,” meaning to go away, and fired a shot which entered the floor about two feet from where she stood. She picked up the baby and ran upstairs, and when she reached the top she heard another shot. The bullet penetrated the wall about five or six feet from where she was at the moment. He husband had threatened several times to shoot her, and she was afraid of him. He always carried a revolver.

“Do you fancy you have treated me as a wife should?” asked Kenny.

“I am quite sure I have,” replied Mrs Kenny, who said the only thing her husband could complain of was that she had told him a lie about 15 months ago to avoid a bother in the house.

528 Police Court, Auckland Weekly News, 6 April 1905, p. 31.
As Kenny ‘seemed somewhat amused’ by her evidence, he was warned by the magistrate ‘that this was no laughing matter’.\(^{529}\) A widow living in the house had heard Kenny tell his wife ‘that she could go, and he would keep the children’. In answer to Kenny’s question, she said Mary had ‘treated him fairly’. She had once seen her slap him ‘in the face, and he did not hit back’. The arresting constable said that Kenny had wanted to frighten his wife, and ‘was pleased’ to be arrested, ‘as it would give him a chance to expose a lot of things in Court’. Kenny boasted of being a good shot, and when formally charged had said, ‘Without intention there’s no guilt’.\(^{530}\)

When on trial in the Supreme Court at the end of May for ‘attempting to intimidate his wife by discharging firearms, with the intention of doing grievous bodily harm’, Kenny said, ‘I am not guilty of attempted murder. If I had attempted murder it would have been murder’. Mary repeated that he seemed to have been drinking and had ‘used some very offensive language towards her’, and stated that he had said Mary’s daughter ‘was pointing out things to him, whereas she was not’. The Crown Prosecutor then questioned her:

Mr Tole: I believe that he has written a lot of things in a book, which you cannot make head or tail of?
Witness: Yes, that is so.
And since the Police Court proceedings, you have received a letter from him from the gaol? – Yes.
Do you know what this letter is about? – No, I do not.
The letter … was then read. In the course of his letter the accused stated that what he had to complain of in regard to witness’ daughter was that she and another girl were always writing notes in books for him to see, which, he said, would go far to show the cause of his conduct. The prisoner then went on to relate a dream which he had had.

A doctor who had examined Kenny ‘believed that he was under a delusion. He told him that he always carried a revolver, as a man at Waihi carried one, and he was afraid he might shoot him. In conversation he was quite irrational. He considered that it was not wise that he should be at large at present’. After all the evidence was heard, the judge told the jury that the ‘medical testimony showed that it would be dangerous to acquit

\(^{529}\) *Thames Star*, 6 April 1905, p. 1.

\(^{530}\) *Auckland Weekly News*, 6 April 1905, p. 31.
him upon the grounds of insanity’, but that they could bring in a special verdict ‘finding that he was insane at the time’. Disregarding this advice, the jury found him guilty of attempting to intimidate his wife, but not guilty of intending to commit grievous bodily harm. In giving sentence, the judge

said that he regarded the prisoner as an honest, hard-working man, who was subject to such delusions that he would be a menace to the public if he were set at liberty. He was very reluctant to treat him as a criminal, and would have been much better pleased if the jury, as suggested by the Crown Prosecutor, and recommended by himself, had acquitted him upon the grounds of insanity. The prisoner should, of course, be committed to the lunatic asylum. He did not know if there was any way of sending him there.

Mr Tole replied that if the man was sent to gaol the authorities would have him examined at once, and, if necessary, transferred to the asylum.

His Honor then passed a sentence of two years’ imprisonment without hard labour. In doing so, he said that when the prisoner recovered sufficiently to be able to petition the Crown, he (the judge) would use his influence on his behalf.531

Not till November was Kenny admitted to the asylum for ‘delusional insanity’, caused, it was believed, by heredity.532 A doctor recorded that he heard ‘voices at all hours of night, whispering outside cell door that he is being persecuted continually, that there is a conspiracy in Gaol to kill him…. Has written letters to a Mr Fitzgerald in which he describes visions of the Virgin Mary and that he has special influence with the Most High’. (Kenny was a Catholic.) Another doctor recorded more conspiracy beliefs. ‘Warders listen at his door at night, that they have a down on him, that he will be even with them yet, gets excited says detectives have worked up a case against him. Asked how he knew there were men at the door, he said he could smell their feet’. His wife informed them that one of his relatives was in a mental hospital. ‘Originally good memory, strong will, passionate, affectionate, energetic, had a severe blow on the head before he left home no cause for grief, solitary life, has 4 children’. His ‘condition’ upon admission was recorded in detail:

531 Auckland Weekly News, 1 June 1905, p. 21.

532 Avondale Asylum, Register of Admissions 1902-1906, no. 3246, YCAA 1021/4, ANZ-A.
Says he was for several years a “Shift Boss” of a mine at Waitekauri and in consequence of his having dismissed two worthless men all the rest of the people conspired to injure him. Mrs Gulson waved lights at him at night to entice him into her house to get him into trouble, during his absence some person entered his house and tampered with his revolver to prevent him from being able to protect himself, one night while in bed he awoke and found the wife of one of the dismissed hands with an axe poised to kill him, as a result of this he came to live in Auckland with his wife children and step-daughters, he found after a while that two of his enemies had followed him and injured his reputation with his family accusing him of being a masturbator etc he used to find proof of this in books his step-daughter read, he would find passages marked in one way or another having vague reference to him, insulting his character etc he demanded an explanation from his wife and not receiving it, fired two shots to frighten her and he was sentenced to 2 years in prison. While he was in prison people conspired against him also.... Patient hints at a close intimacy with God by means of which he found that his wife and family died recently.533

Kenny never improved, continuing to believe asylum attendants were persecuting him, and was transferred to Tokanui mental hospital in 1919, where he died 20 years later.534

A man whose mind was affected by brooding over his financial position was a storekeeper at Waiorongomai, Thomas Henry Whitmore Yate.535 He left home one Thursday while his wife was in Te Aroha.

On the dressing-table was found a note to his wife, referring to their property, his wishes with respect thereto, his will, &c, and in a postscript he stated he was tired of this life and intended to go and lie down and die. Ever since it became known he was missing, search parties have been out in all directions.... Mr Yate had been low spirited of late, and allowed himself to worry unnecessarily about business, and the depression, but we are informed that there was no special difficulty, financial or otherwise to trouble him, and this strange reaction of his appears

533 Avondale Asylum, Case Book 1903-1906, folio 353, YCAA 1048/10, ANZ-A.
534 Avondale Asylum, Register of Admissions 1902-1906, no. 3246, YCAA 1021/4; Case Book 1903-1906, folio 545, YCAA 1048/10, ANZ-A; Death Certificate of Thomas Kenny, 3 May 1939, 1939/27131, BDM.
535 For his full name, see Tauranga Supplementary Electoral Roll, 1887, p. 3.
unaccountable. He was a particularly steady man, and very much respected.536

A correspondent understood that, although ‘not in embarrassed circumstances’, Yate had been ‘for some time in a despondent state’, and during the two days prior to his disappearance had not ‘partaken of food. In his weak condition it is feared that his mind has become affected’ and he would not be found alive.537 After the search parties failed to find him where he was hiding in flax near his home listening to the searchers, after two days and nights in the open he returned late on Saturday night ‘in a very weak exhausted condition’.538 He gave ‘no reason for his strange action’, but ‘for some time past’ he had ‘not been in good health’ because of ‘unwarranted anxiety, and worry about business matters’, which appeared ‘to have upset him completely; as no man in a rational frame of mind would act in such a manner’.539 His wife thanked the searchers and the ‘kindness shown on every hand’. Her husband’s health had ‘been failing for some months past, and this, together with over anxiety and worry about business matters, completely upset him for the time, and led to his acting so strangely’. She hoped that, ‘with complete change, and release from business for a while, he will soon be quite himself again’.540

Within weeks, Yate’s estate was assigned to trustees, who advertised a ‘Found Sale!!!' His goods were offered for sale at from 20 per cent to 50 per cent below normal prices, and the store was being sold as well.541 £1,000-worth of goods would be sold at this ‘very heavy discount’ to ensure ‘an immediate clearance’.542 Clearly he had had cause to brood over the state of his finances. And he had other reasons to brood. In 1887 his second son was born, but he died aged three-and-a-half months after an attack of pneumonia lasting just one day.543 A daughter, born in 1889, would die

when aged four.\textsuperscript{544} Two years later Yate died, aged 61, meaning that he would not know of the death of his first son and last surviving child, who died in Sydney, where his widowed mother had settled, in 1900.\textsuperscript{545}

In 1915, a 46-year-old miner and bushman was committed for delusional insanity lasting a few days. He had had a previous attack.\textsuperscript{546} He told his father he was being ‘persecuted and threatened by wireless messages and was a witness to the battle of Moses’. He told a doctor he was being mesmerized by people using telepathy and electricity shining on his mirror at night.\textsuperscript{547} As these delusions persisted, he was not released. Later he described hearing ‘voices’ jeering at and threatening him, including a threat to burn down his house. In 1918, he claimed to be ‘a stone-reader and anointed the first three stones on this earth’. The following year, when incoherent and occasionally violent, he had ‘delusions of a grandiose type’.\textsuperscript{548} Seemingly this was, at least in part, another example of religious mania.

It was believed some of those committed had inherited their mental problems. For example, when a 23-year-old labourer was committed in 1907, he was assessed as being a ‘congenital idiot’. He would die in the asylum in 1921.\textsuperscript{549} In 1908, a 26-year-old labourer was admitted for congenital melancholia. When aged 23 he had had the first of three previous attacks, resulting in committal to two other asylums. He had ‘impaired health & condition’ when admitted to the Auckland one, but recovered and was discharged four months later.\textsuperscript{550}

Charles Cribb, a farmer in the Waihou and Waitoa districts,\textsuperscript{551} was elected to the local school committees,\textsuperscript{552} an indication of the respect in

which he was held. He invested in one Waiorongomai mine.\textsuperscript{553} In 1886, aged 27, when he was a labourer, he married Ellen Mills, a daughter of James,\textsuperscript{554} who would be the first mayor of Te Aroha.\textsuperscript{555} They were to have six sons, two of whom died in infancy before Ellen died of pneumonia in 1895, aged only 30.\textsuperscript{556} ‘The greatest sympathy has been expressed for Mr Cribb, who is left with four young children’, a Waihou correspondent wrote.\textsuperscript{557} Two years later, he remarried.\textsuperscript{558} In August 1901, he ‘acted in an eccentric manner at Gisborne the other day, and attempted to jump off a hotel balcony’.\textsuperscript{559} Tried on a charge of lunacy, he was committed, and diagnosed as having suffered from alcoholic insanity for four weeks before trying to jump.\textsuperscript{560} He thought he was going mad, and had gone to Gisborne without knowing why. He was judged to be ‘Forgetful Suicidal’. Although his wife said that he had become strange for the past four months, she did not consider he should be committed.

Patient seems to have realized that he was becoming mentally afflicted & he decided to take a trip to Christchurch with his little boy in the hope that the change would benefit him. He arrived with his boy in Auckland but afterwards left for the South apparently forgetting all about the boy. He left the Steamer without any apparent reason & probably tried there to commit suicide.

In the asylum, he had delusions of persecution, claiming that people were annoying him at night.\textsuperscript{561} After being let out on trial in November

1904, he was discharged the following month.\textsuperscript{562} He was never readmitted again, dying in 1948 aged 90.\textsuperscript{563}

Cribb was not the only member of his family to suffer from mental problems. His eldest child, Arthur, was born in December 1886.\textsuperscript{564} In 1914, when farming in the Te Aroha district, he was committed after an attack of ‘congenital delusional insanity’ lasting six months.\textsuperscript{565} His stepmother stated that Arthur, who was unmarried, for some time had been ‘persecuting with his attentions a girl living nearby, whom he says he has married, through the medium of thought readers in Auckland’.\textsuperscript{566} Arthur died six years before his father, still incarcerated.\textsuperscript{567}

In February 1896 Te Aroha’s Observer Man reported that ‘Volunteer A. McK. is the coming ladies’ man’.\textsuperscript{568} Archibald McKee had enrolled in the Te Aroha Rifle Volunteers in November 1894, when he was a messenger aged 17 1/2.\textsuperscript{569} In April 1893 he may have been referred to in a gossip column: ‘Who was the young lady who woke up talking something about an engagement ring? Too bad of you A. McK to let the secret out so soon’.\textsuperscript{570} McKee quickly disappeared from gossip columns because in July 1896, when aged 19 and a post office cadet, he attempted to shoot the postmaster, Thomas Edward Clough.\textsuperscript{571} The community was shocked, as the O.M. reported:

\begin{quote}
It is with much regret I have to communicate the sad news re Archie McKee; he was a general favourite with us all, and, needless to say, a sad gloom has been cast upon us to hear that poor Archie was deranged in his mind, and had nearly shot the postmaster. There are many things sad, but this seems saddest of

all. The poor mother is almost beside herself in her grief. Great thanks are due to those who sat up with the boy at night.572

As the attack of insanity was judged to have lasted for only one day, he was released on probation into the care of his friends.573 Upon admission he was diagnosed as having ‘primary dementia’, caused by an injury to his head.574 The asylum doctors described him as ‘always a cheerful active lad who did his work well. Sometimes given to drink on occasions & has been seen helplessly drunk two months ago. Sustained an injury to his head by falling from his horse’, and after suffering from a headache for two weeks, had shot at his superior.575 Had he been drunk when he fell from the horse?

When McKee was tried for attempted murder, Clough gave evidence that he ‘always did his work well’, and being ‘very well satisfied with him’, on the day of the shooting he had promoted him from messenger to assistant. McKee had seen £88 on the office table, and that evening lured Clough out of the office on the excuse that a man had had a fit. When the rifle was fired close to him, Clough asked McKee, ‘What are you shooting at me like that for?’, to which the latter replied, ‘I did not know it was loaded’. When followed towards the river, McKee again fired at him, but as Clough pushed the barrel aside the shot missed him. When the constable came on the scene, he considered that McKee was ‘stark staring mad’ because he was ‘convulsed and bent himself up like a half-moon – in fact, he had never seen a man in such a state’.576 When locked up, McKee ‘was convulsed every half hour’ from ‘severe shock’. The constable ‘knew that at Volunteer banquets accused was inclined to imbibe too freely’.577

When the adjourned case was resumed, the Crown solicitor explained that it seemed McKee was ‘pressed for money’, having borrowed £5 which he could not repay. After Clough ‘clutched McKee after the second shot was fired’, he called out, ‘Oh, Mr Clough, what have I done?’ After being struck several times, ‘McKee put his hand on his head and said, “Oh, my head, my head.” Mr Clough saw a terrible change come over the young fellow’s face

then, and thought he had gone mad'; his eyes 'rolled about and his features were contorted'. Clough understood that he had sustained a fractured skull when thrown from his horse about three months previously. The asylum records confirmed a depression on the skull where McKee complained of pain. His mother gave evidence of having noticed 'a difference in him some time prior to the shooting affair. His face would twitch at times, and he could not sleep at night'. During the month before the shooting occurred,

she could not understand a silly look he had about his eyes. One night he came home looking strange and pressing his head with his two hands as if it were paining him. Sometimes he would come into the house and sit down and stare at the window. When witness called him he would not answer. Subsequently she sat up with him on several nights. Each time he seemed to be suffering pain in his head. On one occasion the accused drove a party to the Thames, but afterwards did not remember anything about it. Now he did not recollect some things which happened before the shooting, and other things which had happened since.

Doctors gave evidence of the depression in his temple which could have created his homicidal mania. After being asked by the judge to consider whether they thought McKee was insane at the time of the shooting, they decided that he was, and he was sent back to the asylum, where he remained for five months before being released as recovered.578

No further attacks of madness were recorded, but in 1901 he was convicted at Waihi of stealing from a gum merchant, and, despite the magistrate's reluctance to imprison him because of his having been in the asylum, as his friends were unable to raise the sum of money required for restitution, he was sentenced to 12 months in prison.579

SUICIDE

In 1895, the Observer wrote that 'the suicide mania is still going on. There is no doubt it is a “perfect cure” for the troubles of this world. Whether it is so for those of the next is a moot point'.580 Examples of attempted suicide are included in the paper on crime, and some examples of

578 Supreme Court, New Zealand Herald, 10 June 1897, p. 3; Avondale Asylum, Admissions Register 1896-1901, no. 2234, YCAA 1021/3, ANZ-A.
580 Observer, 21 December 1895, p. 7.
successful suicides are included in papers on men’s lives.\textsuperscript{581} The suicides of Jessie Smith and Elizabeth McLiver are included in the paper on women. There were several other suicides by those involved at one time in mining at Te Aroha, but as they did not live in this district these are not recorded.

In 1888, William Lincoln, a 50-year-old painter and glazier, committed suicide by jumping off the railway bridge and drowning. A single man, he had come to New Zealand in 1868 and had settled at Te Aroha before the goldfield opened.\textsuperscript{582} At the inquest, a cabinetmaker stated Lincoln visited his workshop ‘every day’.

He last saw deceased about twenty minutes past four on Tuesday, when he came and picked up a sack off the workshop floor and cut it in half, at the same time he asked for a mattress needle and some twine, which witness brought; but declining to let him take the needle away, he left without making use of it. He saw him take down a piece of small rope from a post and carry it away when he left, only remaining about five minutes altogether. He asked him what he intended to do with the sack, but he did not say. He appeared to have taken a little drink, but was well able to take care of himself. He said to him, “Billy you’ve had a pint or two – take my advice and go to bed,” to which he replied, “All right,” and when he left went off towards his house. Witness recognised the piece of rope and half sack, produced (and which was round deceased’s neck – the sack having a quantity of clay in it – when the body was recovered), as the same that he carried away.... He had a long conversation with deceased Tuesday morning, and although he complained of dull times, he appeared to be in very good spirits; said he had got a job, and that a £1 would pay all he owed. Witness had known deceased as a resident at Te Aroha for the past ten years and previously at the Thames. He had no relatives in the Colony, and was never married. He was fifty years of age. Deceased believed he had a brother living in London, never having heard of his death, but he had not heard from him for over twenty years; and did not know his address.

A merchant who had helped to recover the body had seen Lincoln before he took his life. ‘He appeared as though he had taken a little drink, but was quite capable of taking care of himself’. Two girls described seeing Lincoln ‘climb over the railings of the bridge, on to one of the stringers, and after adjusting the rope and sack round his neck, let himself down, hang by his hands and then drop into the river’. Two flaxmill workers had seen him

\textsuperscript{581} For example, papers on George Stewart O’Halloran and Charles Gallagher.

\textsuperscript{582} \textit{Te Aroha News}, 28 November 1888, p. 2.
hanging by his hands for ‘about half a minute’ before letting go and dropping into the river. Another saw him sitting on the bridge for about three minutes before letting himself down and hanging by his hands. ‘Before he dropped he appeared to try and draw himself up again’. The jury’s unavoidable verdict was that Lincoln had drowned himself, without adding the usual caveat that he had done this ‘while the balance of his mind was disturbed’, although it must have been. No reason for the suicide was determined, although relative poverty and being a single man who had lost contact with his family may have been factors.

CONCLUSION

During the early decades of Te Aroha and Waiorongomai, residents struggled with usually unpreventable physical problems with little professional assistance. These problems were sometimes created or exacerbated by unsanitary habits, lack of pure water and sewerage, or, in the case of miners, some of the unavoidable conditions of their employment. These experiences were typical of those endured by miners generally and of residents in other small towns and villages. Mental problems were believed by those treating them to have been created by disappointment in love, poor physical health, obsession, alcohol, religious mania and other delusions, heredity, and financial worries; once again, these would have been typical for people living elsewhere.

---

583 Te Aroha News, 1 December 1888, p. 2.
