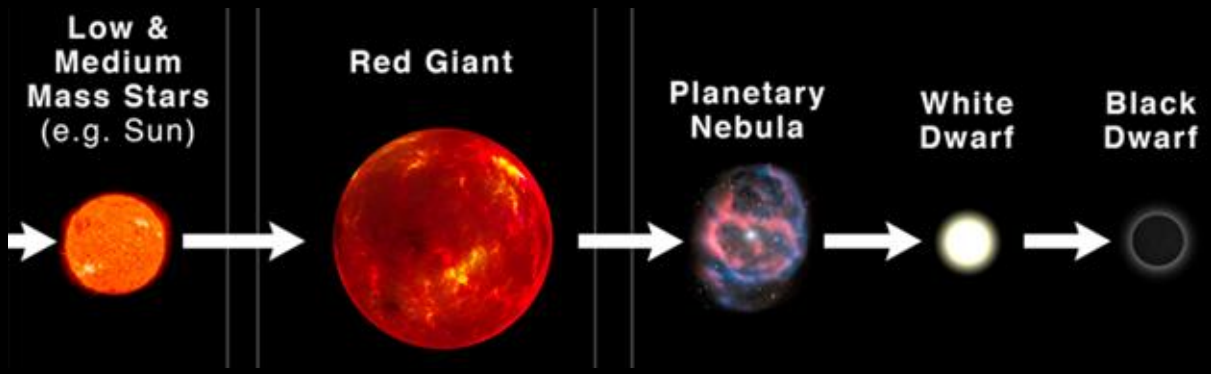
Formation of a proto star, planets are formed as rotation occurs with material left over

Life Cycle - Sun-Sized Star

Planetary Nebula - Fusion of helium → carbon stops when all helium is used, the hydrogen 'red' shell is 'blown' away. These outer layers form a planetary nebula.

White Dwarf - This leaves behind a core of Carbon (smaller than 1.4M_{sun} so no fusion of carbon can occur). A white dwarf radiates heat for billions of years. Overtime, this star continues to cool and redden

Black Dwarf - When all heat is used, the star becomes a dead star made of carbon. It is cold and dark in colour



Life Cycle - Huge or Massive Stars

Supernova - the core collapses once Fe is made. Gravity and pressure from electrons cause the core temperature to 100 billion K. Iron atoms becomes compressed and begin to repel each other. These forces overcome gravity and cause a bright, short explosion (a supernova).

Neutron Star - if the core is between 1.5 - 3Msun, it collapses making a small, dense neutron star. It has a strong magnetic field and fast spin

Black Holes - only the largest stars.

The gravity causes the core to collapse in on themselves.

Black Hole

Different Types of Stars

MASSIVE STAR → supergiant → supernova → blackhole

~ 1 million years

HUGE STAR → supergiant → supernova → neutron star/pulsar

a few million years

SUN-SIZED STAR → red giant → planetary nebula → white dwarf → black dwarf

10 billion years

RED DWARF → white dwarf → black dwarf

50 billion years

White dwarf vs Earth

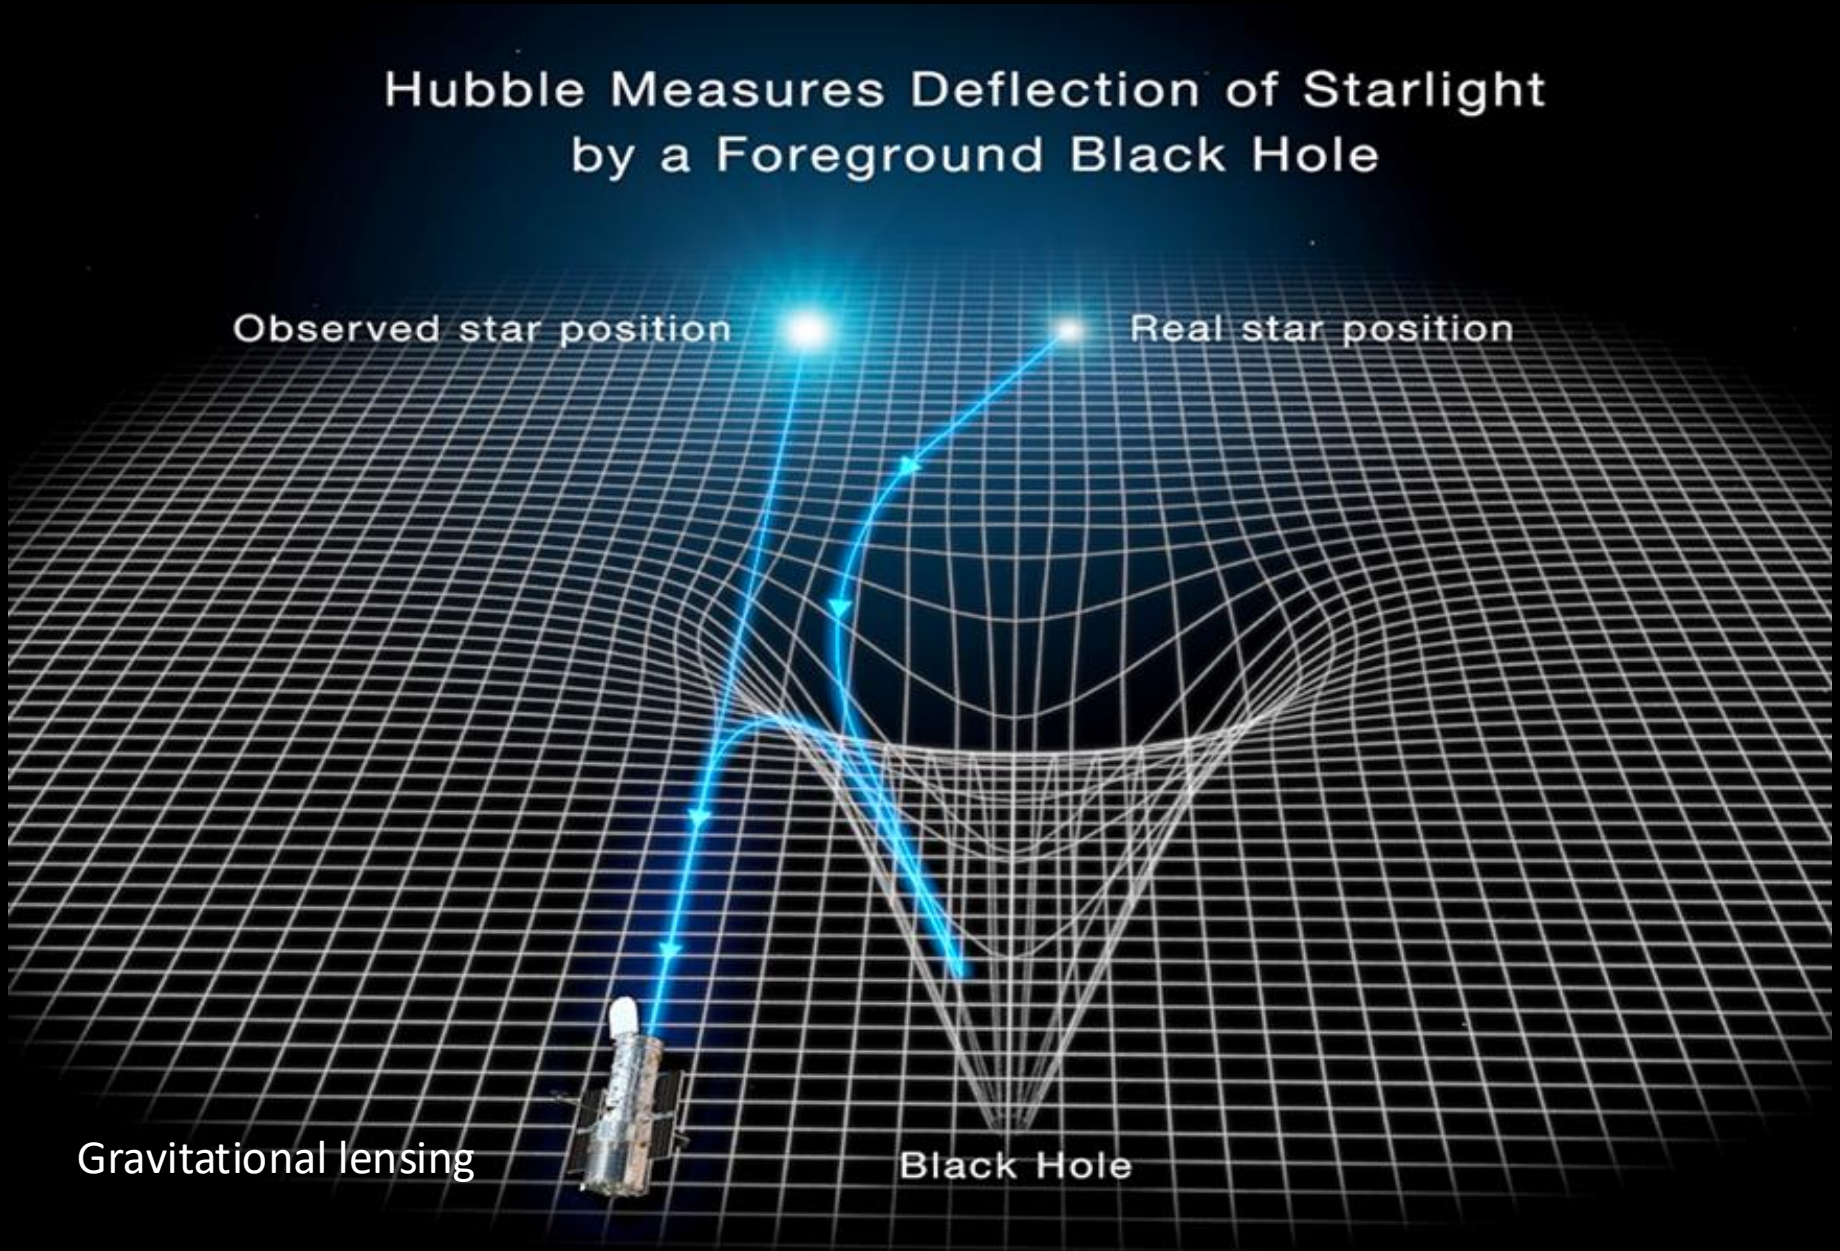
Black Holes

After the supernova, if the core of the star is greater than $3M_{sun}$, a black hole is formed.

Black holes are areas of intense gravity - not even light can 'escape' the gravity, anything that is close enough will be pulled into the black hole

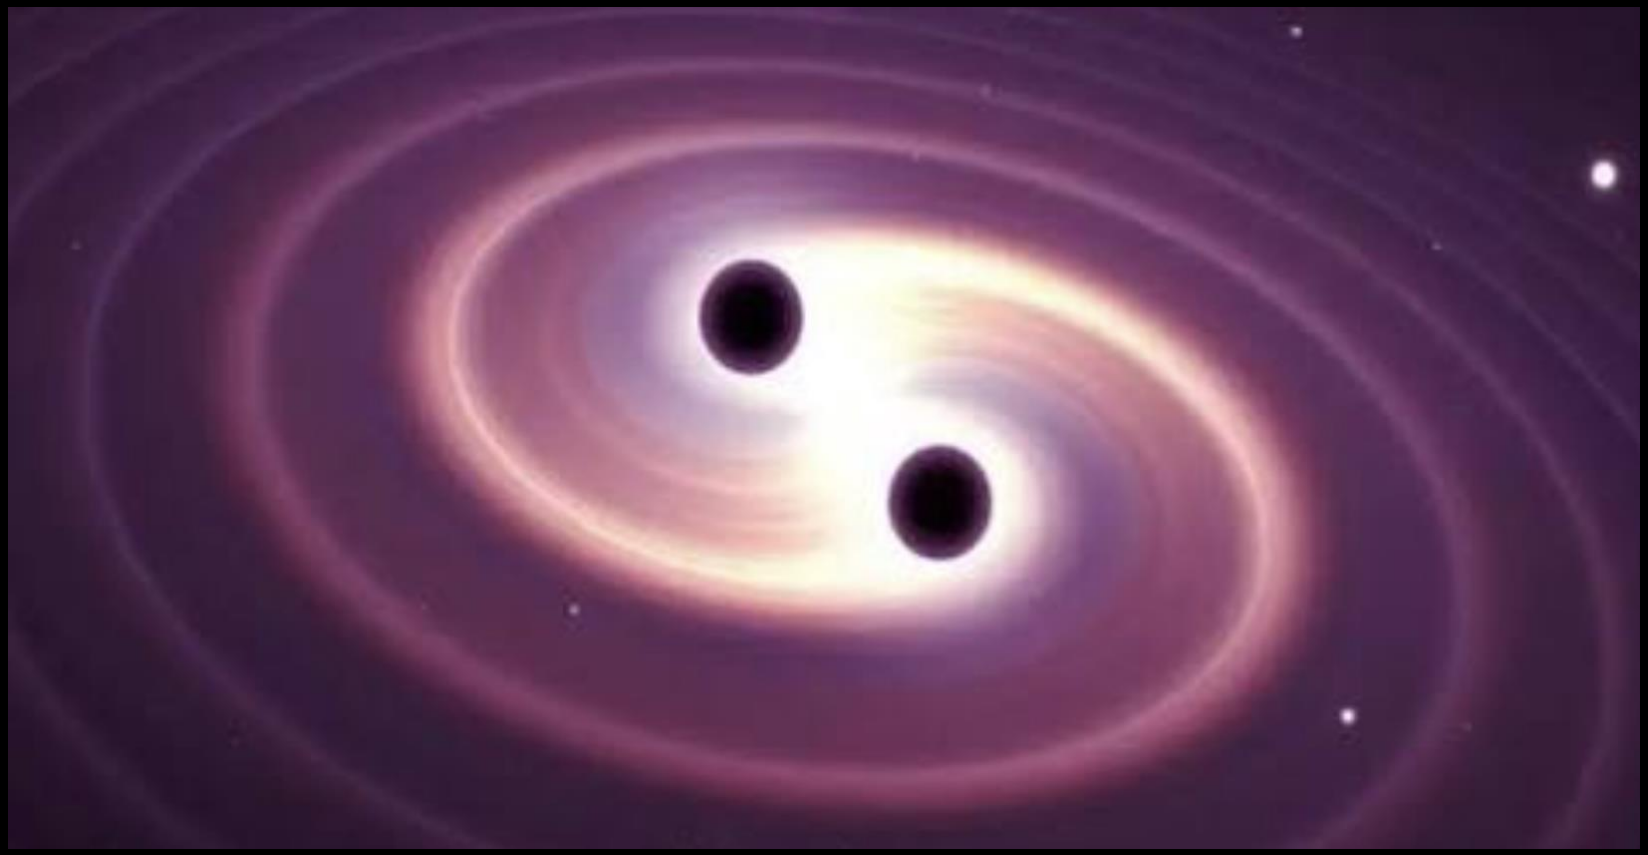
They can't be directly observed as light doesn't escape, but the warping of space around the black hole (due to gravity) can be observed.

Black Holes



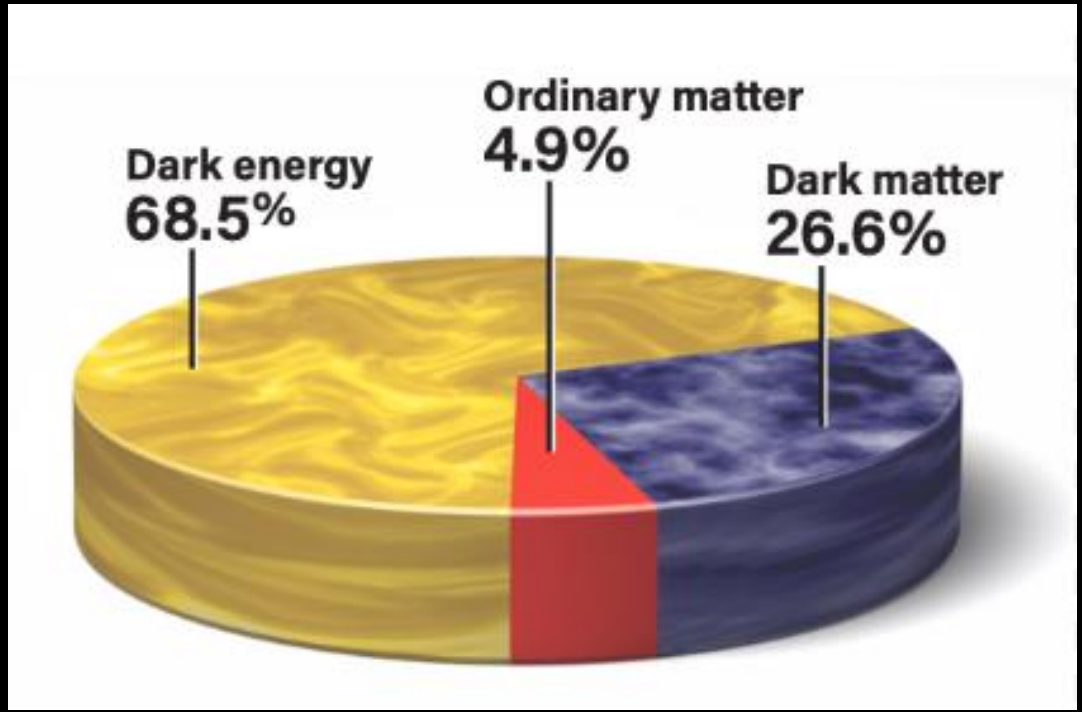
Gravitational lensing

Gravitational waves



A pair of neutron stars rotating together (artist impression)

The universe is made mostly of dark matter and dark energy



Rachel Jenkins

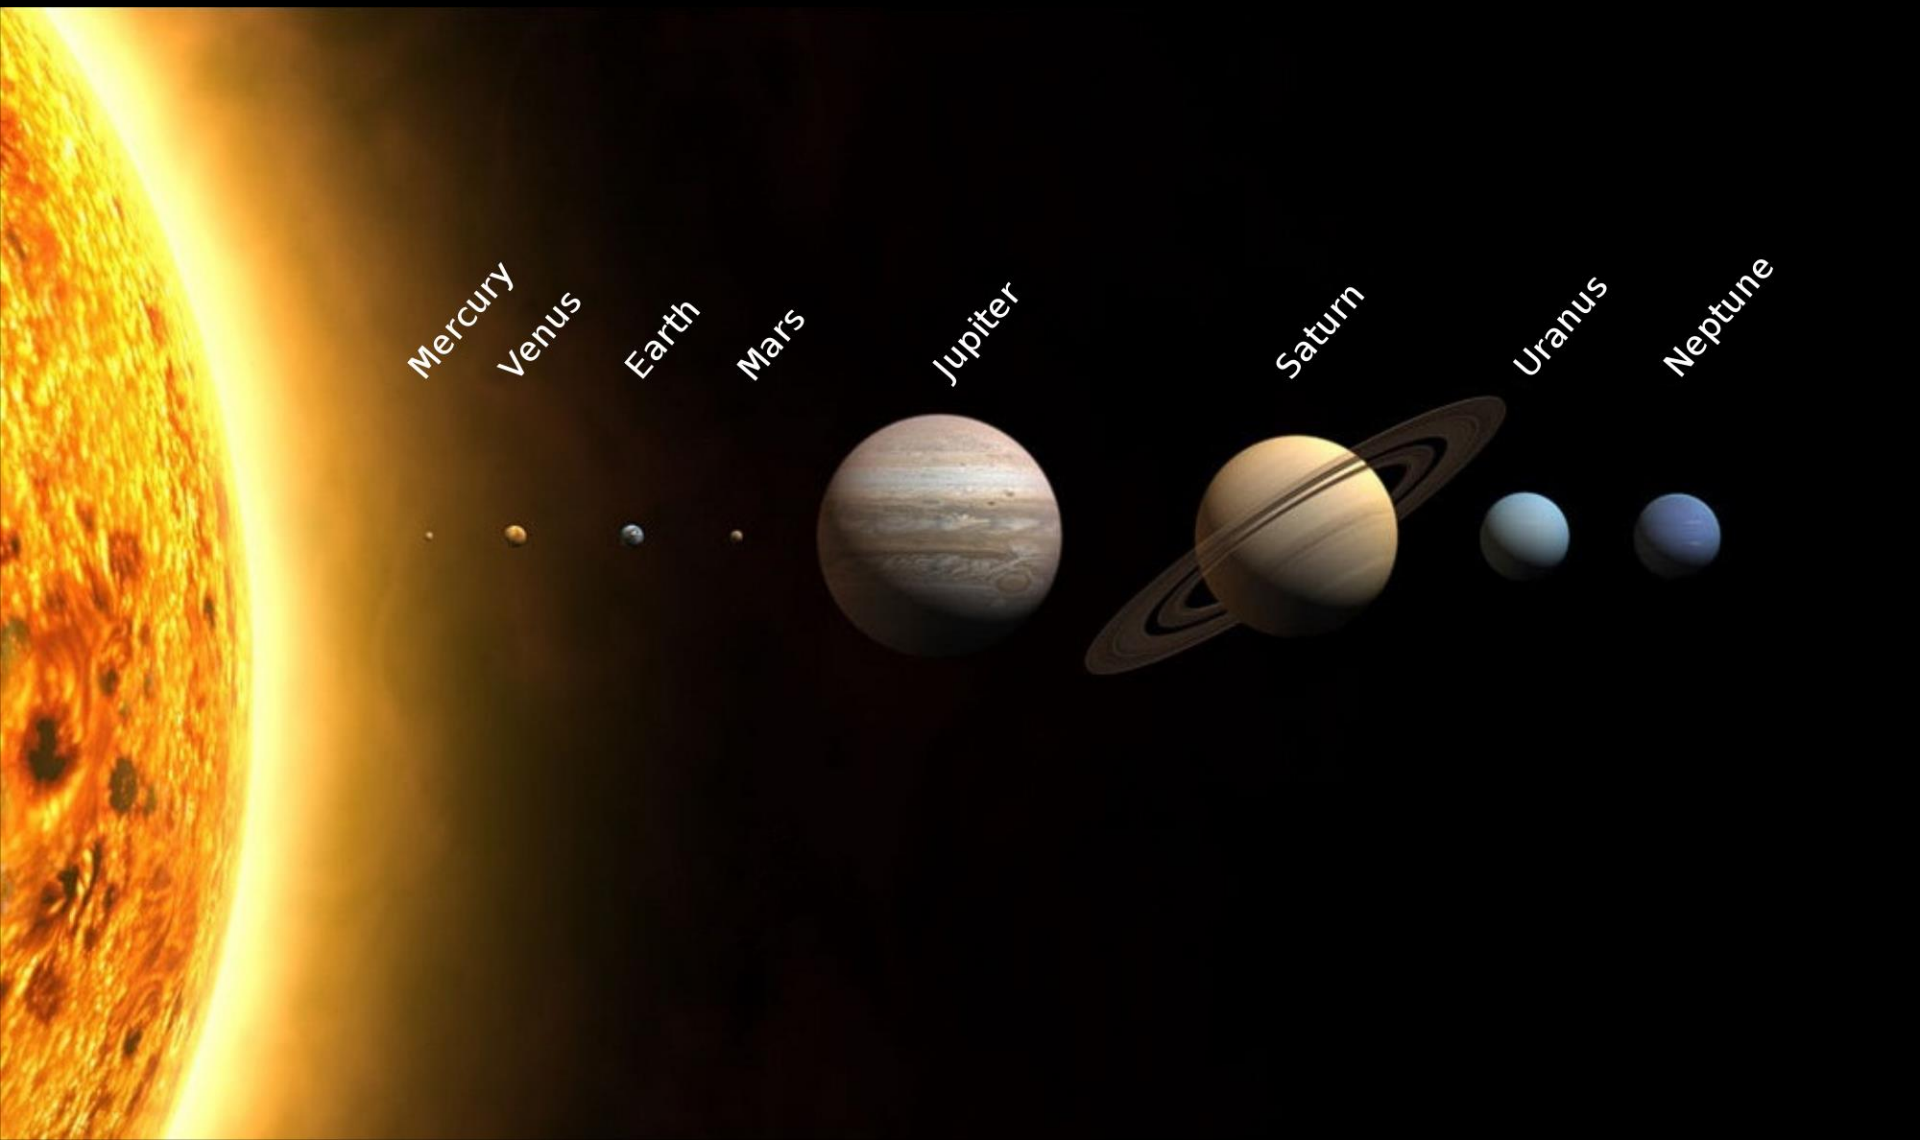
Instead of subatomic particles being hard, solid dots, string theory suggests they are tiny, vibrating strings of energy.

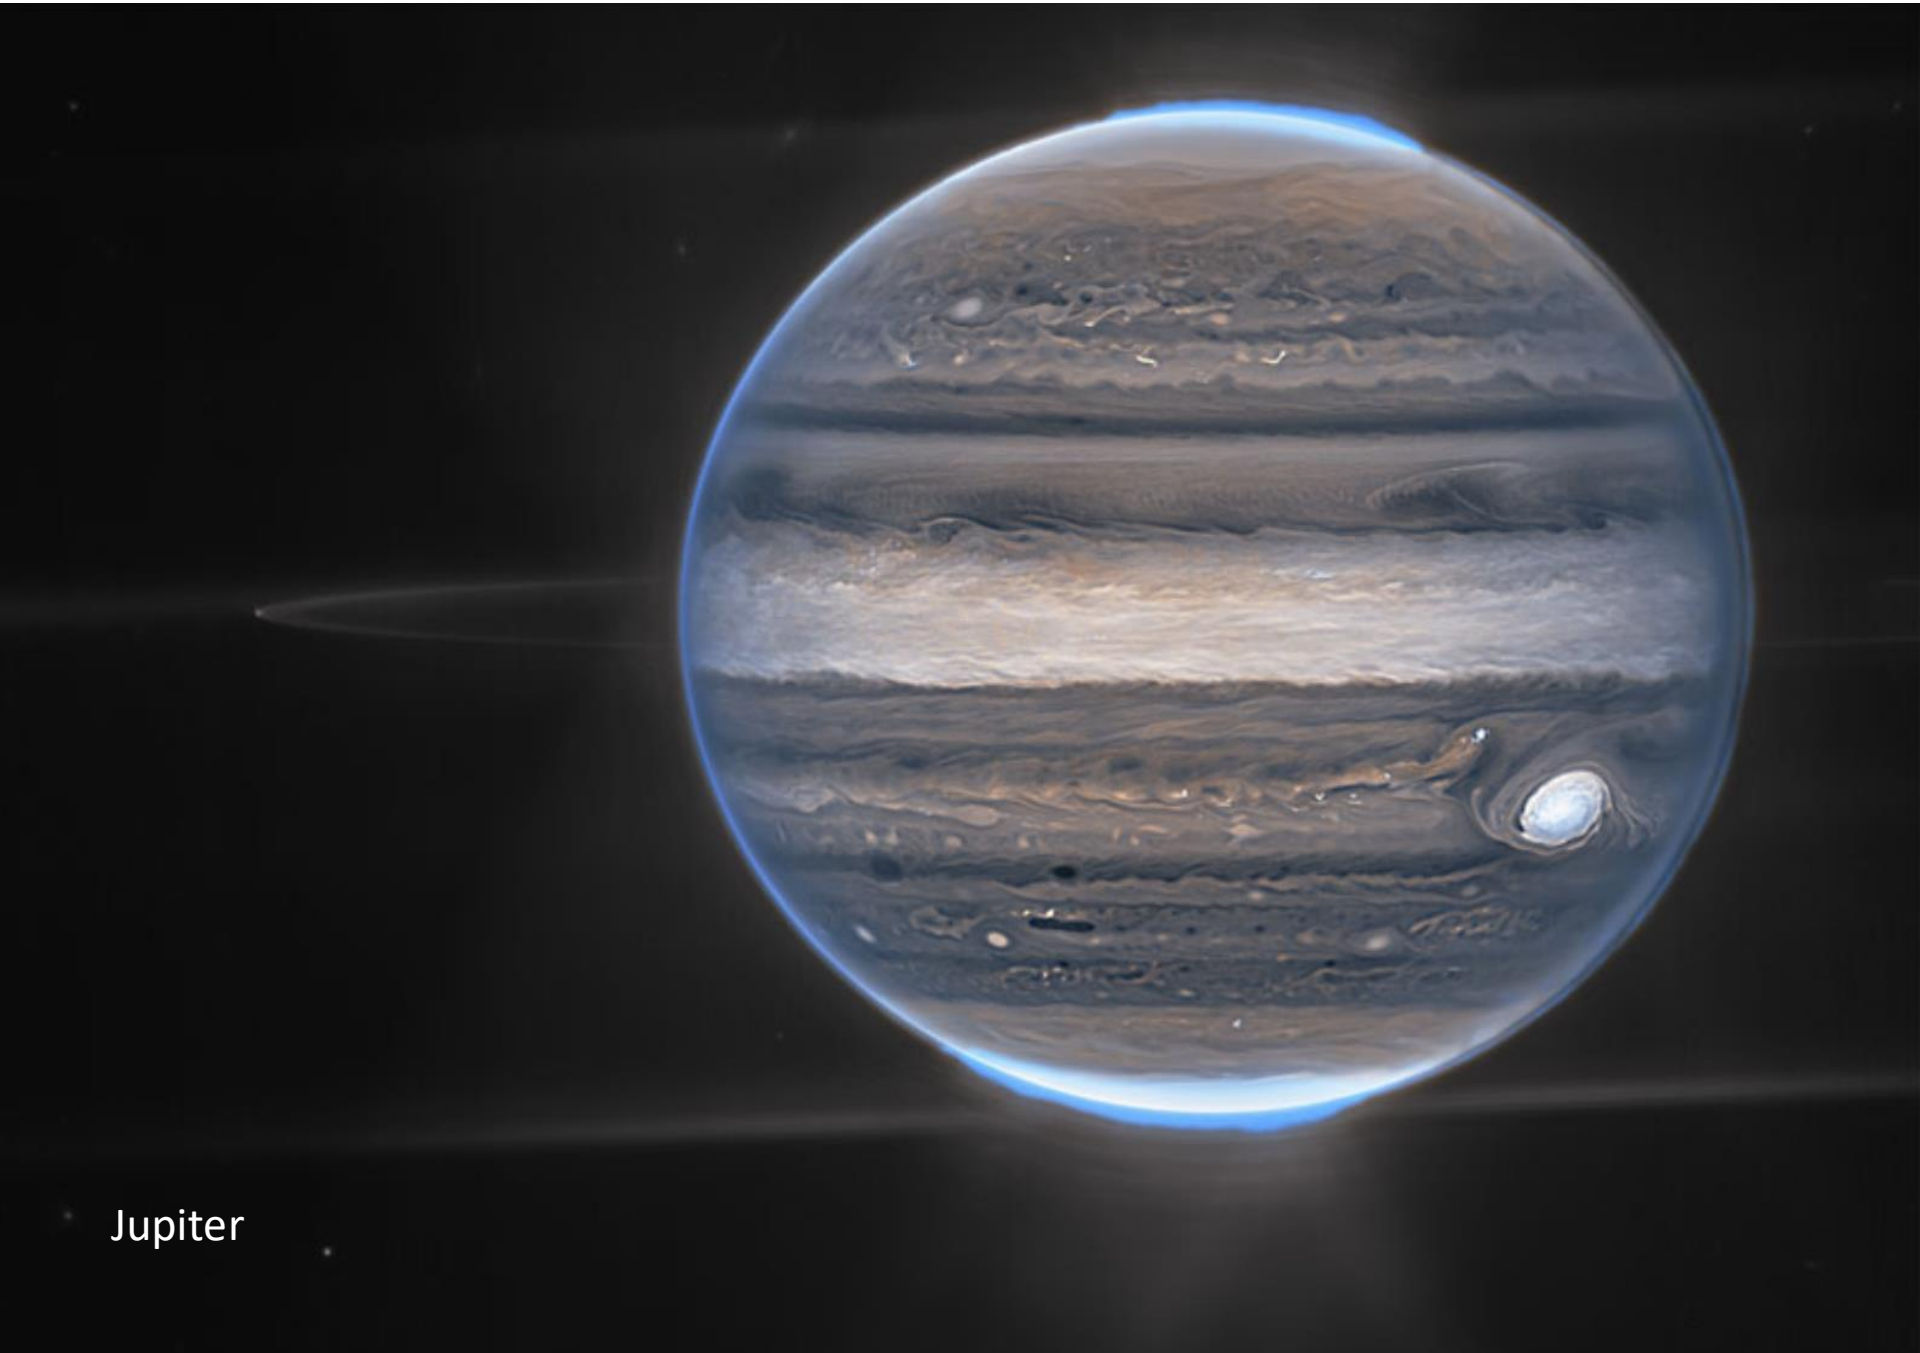
Just as different vibrations on a piano string create different musical notes, different vibrations of these cosmic strings create the different particles in the universe (including the invisible particles that may make up dark matter).

In this view, the universe is essentially a grand symphony.

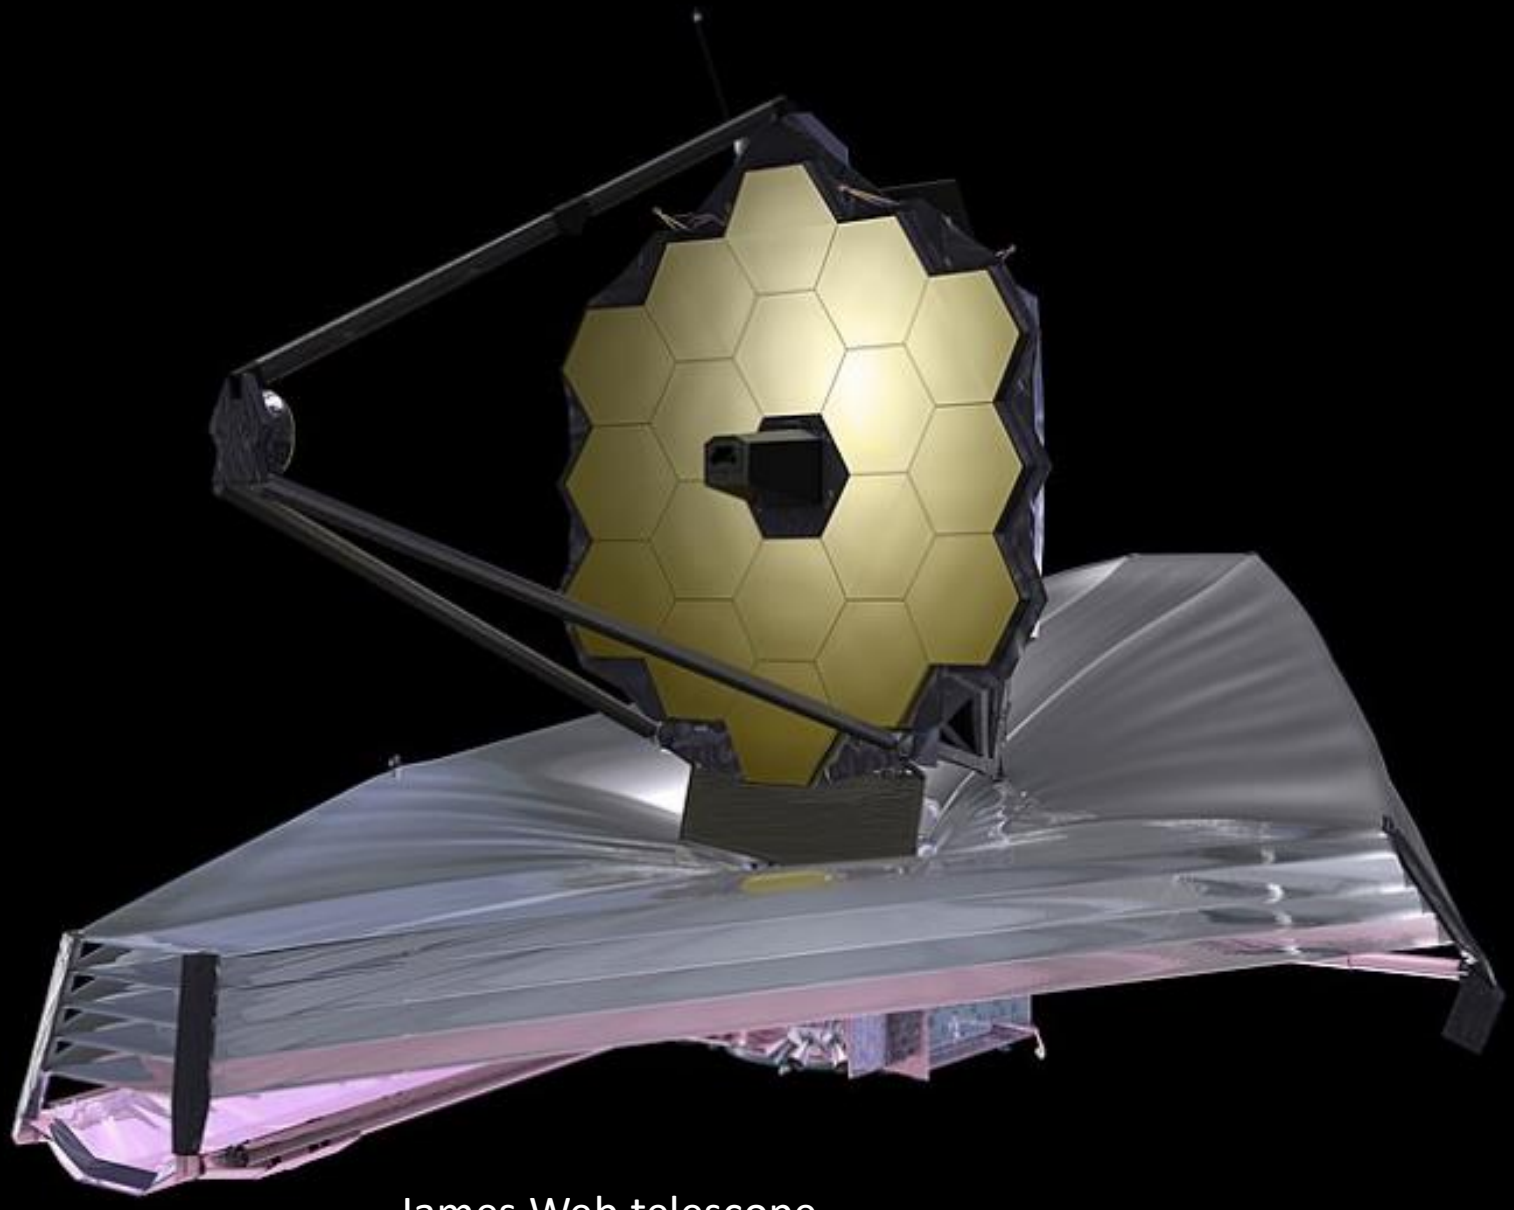
“Sink before the Moon” by Rachel Jenkins

Our solar system





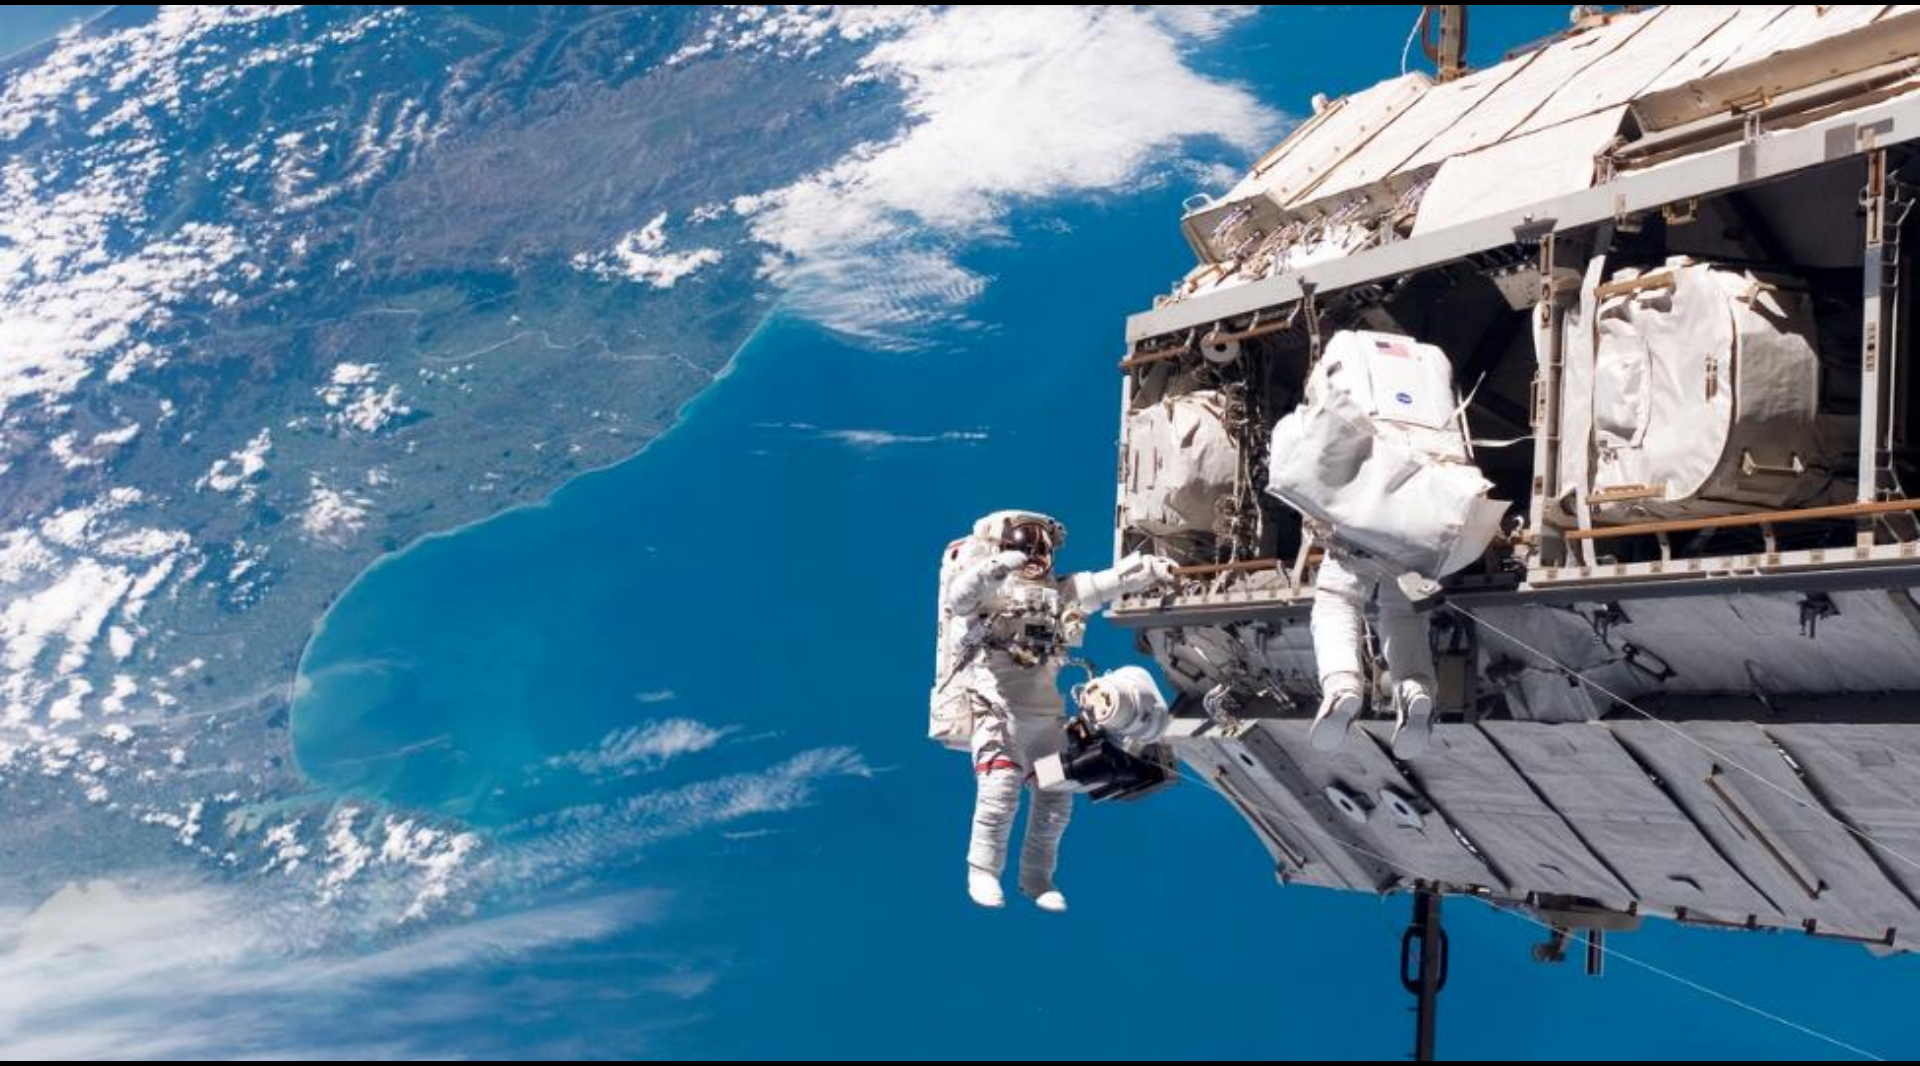
Jupiter



James Web telescope

International space station –view of south island, January 2020
70m long, 100m wide, travels 7.6 km/sec, 400km altitude, ten people on board now, rotates around the Earth every 90 minutes

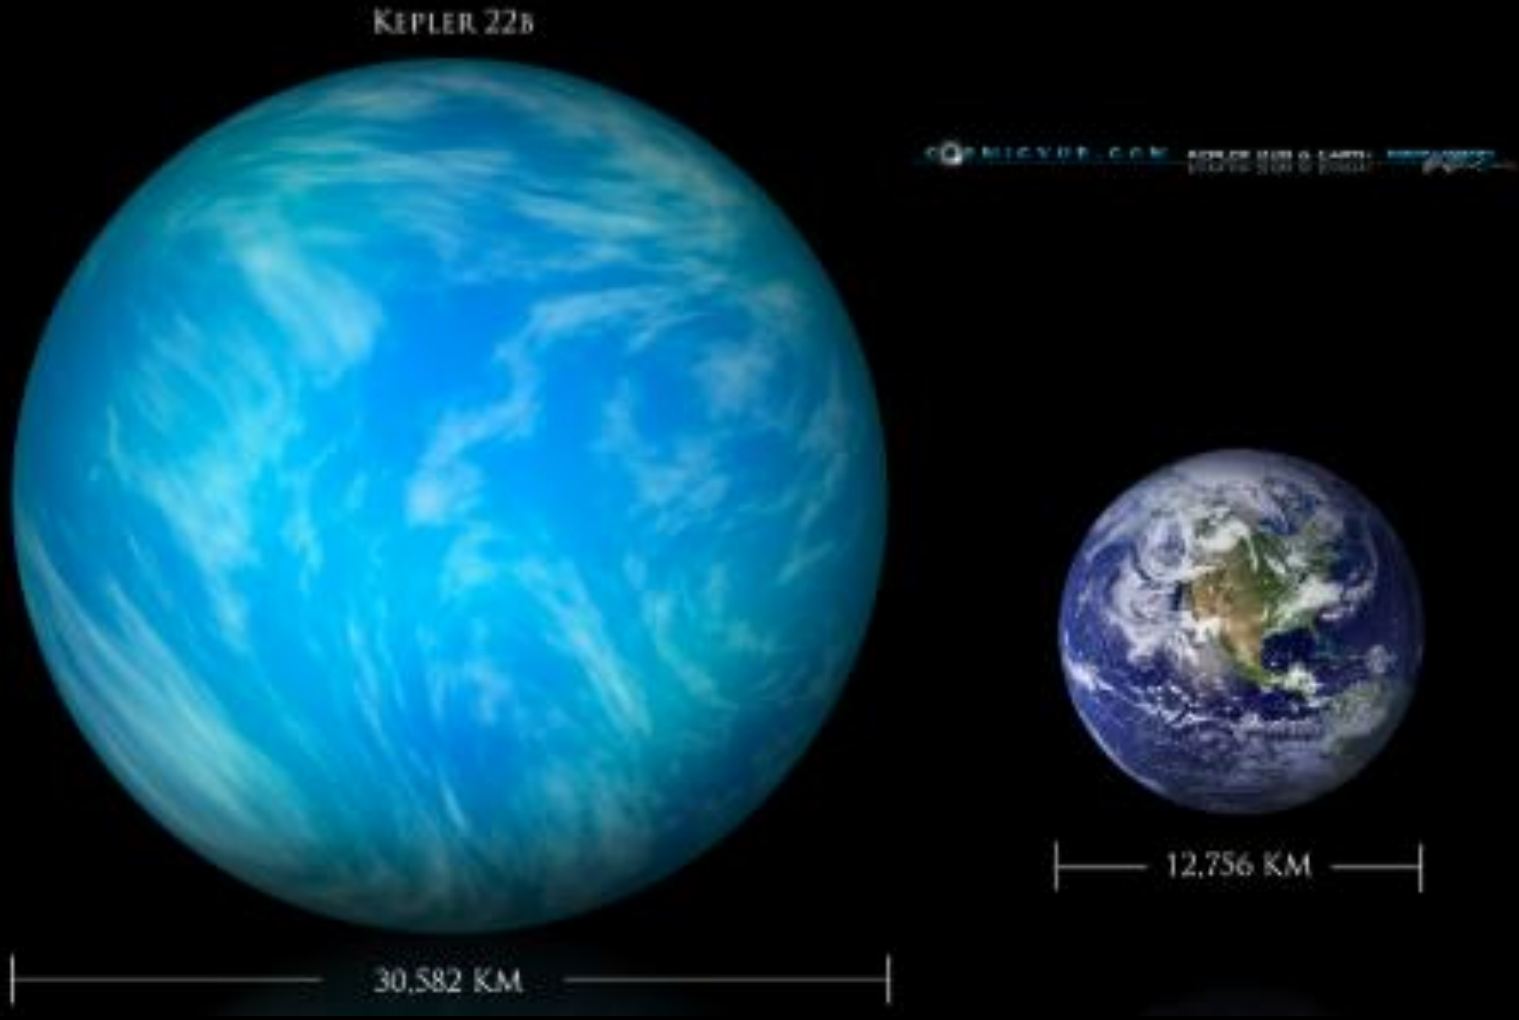
Planet Earth



The International Space station 400km above the South Island

Is there life beyond Earth?

TOI 700d- Earth sized exo-planet found in January 2020, it's well outside of our solar system orbiting a red dwarf star, in the Dorado constellation about 100 light years away



Kepler 22b-another exoplanet, 640 light years away, host star Kepler 22, planet's average temperature 22 degrees Celsius, 2.5 times bigger than our Earth.

Could there be intelligent life on other planets?

Exoplanets around red dwarf stars

Could humans live on Kepler 452-b?

Kepler 452-b another exoplanet is 1800 light years away, orbiting a star like ours, it is nicknamed “Coruscant”, which is the name of the home of the Galactic Empire in the Star Wars films.

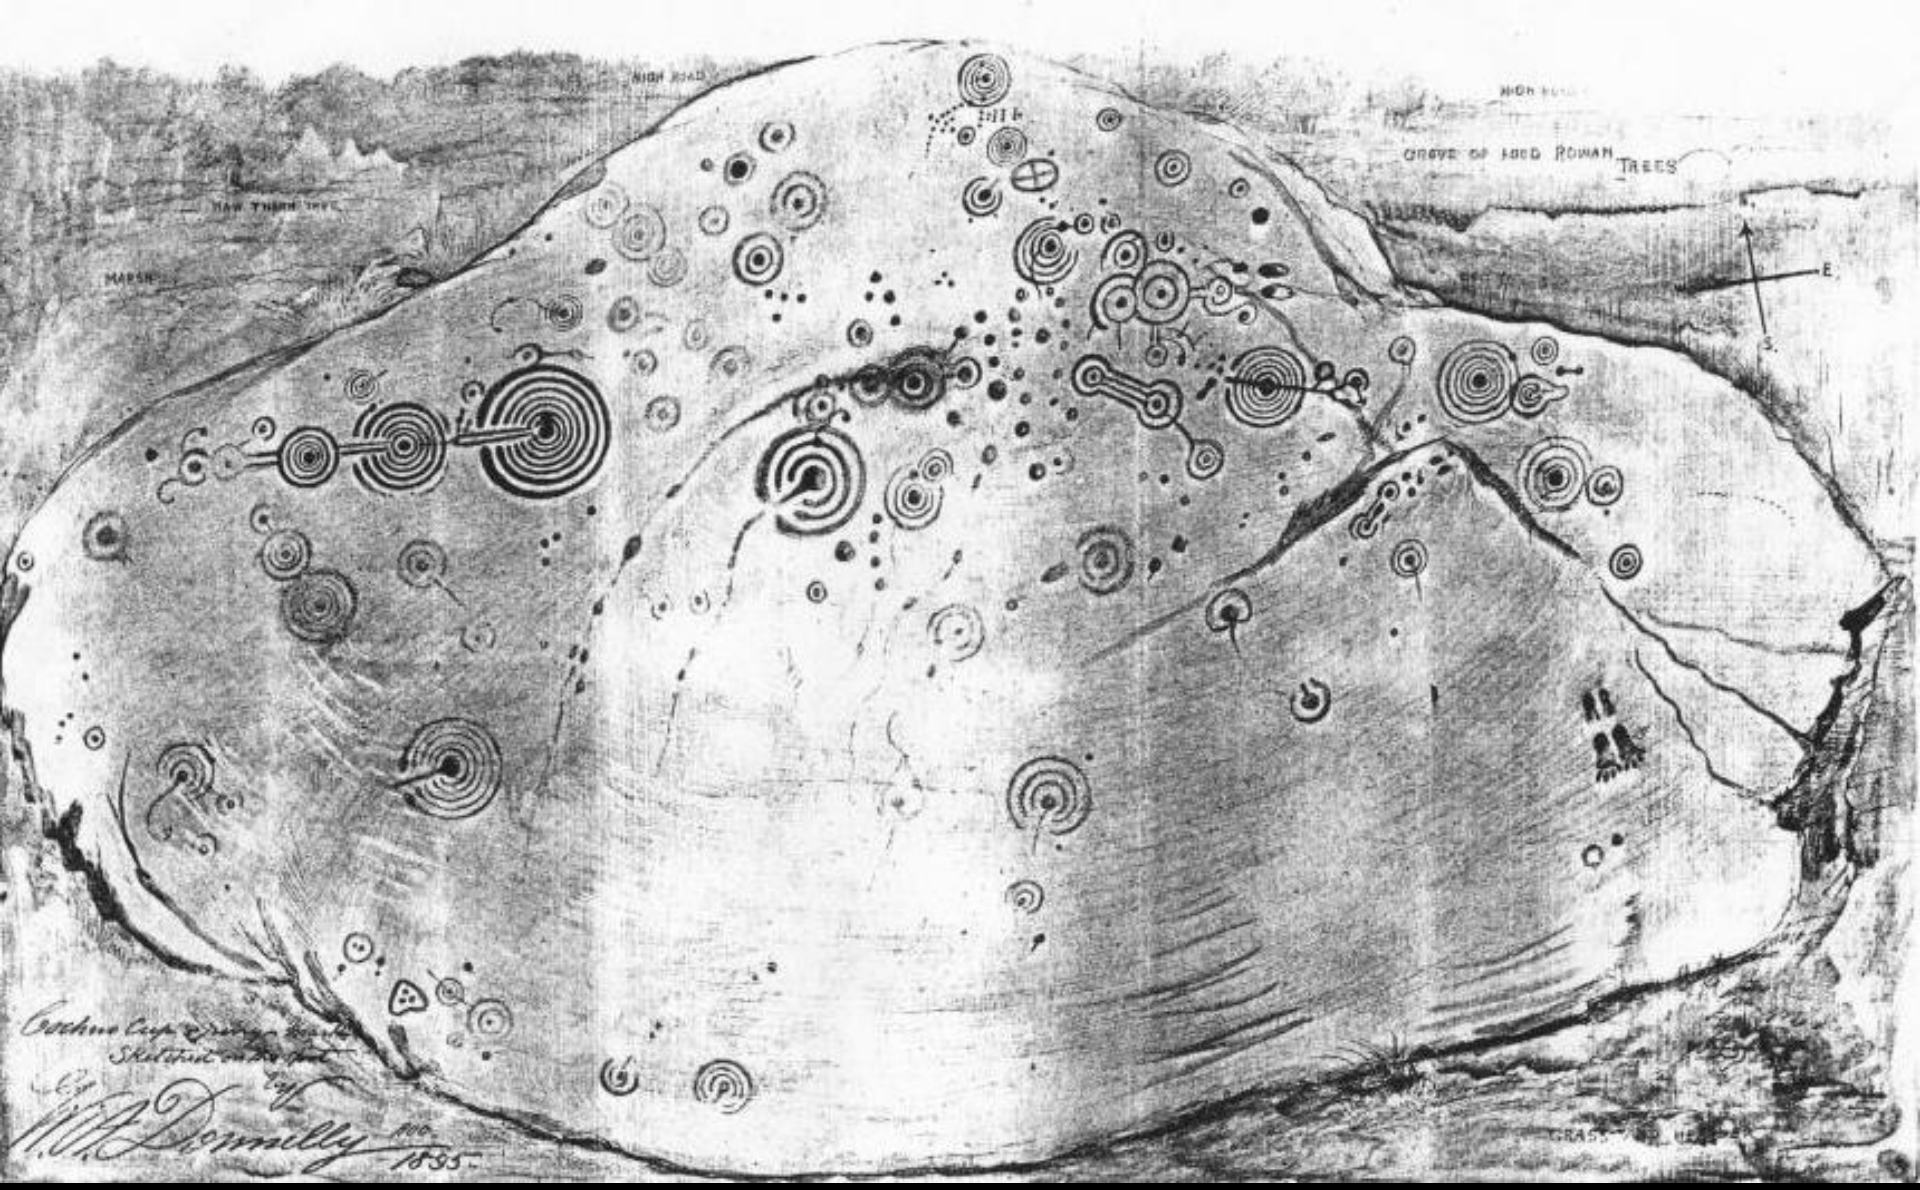
Space travel challenges

Vast distances, radiation protection, time travel, fuel, storing the fuel



The Cochno stone (13m x 7m), Faifley, West Dunbartonshire, Scotland,
Bronze age 3000 BC to 1200 BC

Archaeology meets cosmology- the Cochno stone (13m x 7m), Scotland.

My final thoughts and thank you for coming along tonight

I believe astrophysics, archeology, philosophy, even music merge together as realms to solve cosmic interactions, all can support the other in further understanding the universe, there are definitely parallels between them, the important thing for me is to keep an open mind.

The more I explore the atom and the universe, the more I sense that life is a cosmic dance, where atoms are patterns of energy, not solid spheres. There is nothing really solid about us.

Our own atoms come from an old star, we are the cosmic dance and perhaps the universe is a giant piano that plays the beautiful music.

Simon Taylor
